Can sex selection be ethnically tolerated?

B M Dickens

Prohibition on sex selection may well be unnecessary and oppressive as well as posing risks to women’s lives

The urge to select children’s sex is not new. The Babylonian Talmud, a Jewish text completed towards the end of the fifth century of the Christian era, advises couples on means to favour the birth of either a male or a female child.¹ The development of amniocentesis alerted the public in the mid-1970s to the scientific potential for prenatal determination of fetal sex,² and progressive decriminalisation of abortion afforded choice about continuation of pregnancy. The more recent emergence of pre-implantation genetic diagnosis (PGD) obviates resort to abortion, and improved techniques of sperm sorting and diagnosis permit creation of zygotes that will ensure the sex of a future child.

Growth of biomedical means to select the sex of future children has been accompanied by fear that such means will be employed to favour births of sons, and so perpetuate devaluation of girl children and women’s inferior family and social status. A reaction to this fear has been the demand for legal and social status. A reaction to this fear has been the demand for legal and progressive de-criminalisation of abortion afforded choice about continuation of pregnancy. The more recent emergence of pre-implantation genetic diagnosis (PGD) obviates resort to abortion, and improved techniques of sperm sorting and diagnosis permit creation of zygotes that will ensure the sex of a future child.

Any change in custom or practice in this emotionally charged area has always elicited a response from established custom and law of horrified negation at first; then negation without horror; then slow and gradual curiosity, study, evaluation, and finally a very slow but steady acceptance.³

The established custom that was initially, and in some cases is still, horrified at recognition of the potential for effective sex selection of future children was not only that of conservative religion, but also that of some components of organised feminism. By the 1980s, feminism was becoming a politically influential force in Western Europe, North America, Australia, and several other westernised democratic countries.⁴ The dilemma posed by sex selected abortion is that many feminists, not all of whom are women, consider choice in abortion to underpin women’s moral agency and the defence of their self determination. A leading modern analyst has observed that:

Whatever the specific reasons are for abortion, most feminists believe that the women concerned are in the best position to judge whether abortion is the appropriate response to pregnancy. Because usually only the woman choosing abortion is properly situated to weigh all the relevant factors, most feminists resist attempts to offer general, abstract rules for determining when abortion is morally justified . . . . Despite the diversity of opinion found among feminists on most other matters, most feminists agree that women must gain full control over their own reproductive lives if they are to free themselves from male dominance.⁵

The dilemma posed by sex selected abortion is that many feminists, not all of whom are women, consider choice in abortion to underpin women’s moral agency and the defence of their self determination. A leading modern analyst has observed that:

Sex selected abortion, however, is seen as an instrument and consequence of male dominance that feminists are committed to oppose. It has been observed that “I’m sure feminists view any efforts to plan the sex of future children as epitomising sexism”.⁶ Writing about abortion in 1986, a prominent pro-choice advocate stated: “We believe abortion-for-gender choice is an unqualified moral wrong”.⁷ Opposition to means of sex selection that are made possible by PGD and sperm sorting avoids the dilemma posed by sex selected abortion, and affords opponents the support of conservative anti-abortion agencies, as well as of others committed to the elimination of the pro-male sexism that sex selection is seen to represent.

The stereotypical concept that pro-male sexism is inherent in sex selection, rooted in perceptions of pervasive devaluation of girl children, may be contradicted in particular countries, however, by empirical studies. For instance, summarising the conclusion of a comprehensive sociological survey and public presentations, members of the Royal Commission on New Reproductive Technologies in Canada reported in 1993 that:

The survey revealed that, contrary to what has been found in some other countries, a large majority of Canadians do not prefer children of one sex or the other. Many intervenors . . . assumed that Canadians have a pro-male bias with regard to family composition; we found that this assumption appears to be unfounded.⁸

Interest in sex determination was first raised in India, China, and other countries and cultures in which son preference is apparent, many analysts and commentators have envisioned the use of techniques of sex selection only as reinforcing male dominated sexism and women’s subordination.

Any change in custom or practice in this emotionally charged area has always elicited a response from established custom and law of horrified negation at first; then negation without horror; then slow and gradual curiosity, study, evaluation, and finally a very slow but steady acceptance.³

For instance, summarising the conclusion of a comprehensive sociological survey and public presentations, members of the Royal Commission on New Reproductive Technologies in Canada reported in 1993 that:

[10] The stereotypical concept that pro-male sexism is inherent in sex selection, rooted in perceptions of pervasive devaluation of girl children, may be contradicted in particular countries, however, by empirical studies. For instance, summarising the conclusion of a comprehensive sociological survey and public presentations, members of the Royal Commission on New Reproductive Technologies in Canada reported in 1993 that:
Preferences were generally seen as unimportant, almost trivial. The survey showed that virtually all prospective parents want, and feel strongly about having, at least one child of each sex.1

Nevertheless, invoking perceived feminist values, the commissioners recommended criminalisation of the use of sex selection techniques, which is now proposed in the legislation introduced in May 2002. This legislation is comparable to that enacted in India in 1994, but raises the ethical issue of whether the social circumstances the legislation is intended to affect are comparable. The ethical principle of justice, considered at a formal or abstract level, requires that like cases be treated alike, and that different cases be treated with due recognition of the difference; that is, it is as unjust and unethical to treat different cases alike as to treat alike cases differently.10 Male dominance may be comparable in Canada and India, but the evidence is that sex preference between children is different.

There may be the same preference in some families for a firstborn child to be male, but this preference, if offensive to equal priority and opportunity between the sexes, can be addressed by permitting sex selection only for second or subsequent children, rather than by absolute prohibition. Under a limit of this nature, allowing sex selection for purposes of family balancing in countries in which no demonstrable pro-male sex bias exists among prospective parents appears at least ethically neutral and tolerable.11 Support lies in such tolerance contribut-
ing to respect for prospective parents’ belief that races other than one’s own are inferior of his or her own race may be based on the contrast between racist and racial choice. It is as objection-
able for a decision to be sexist as for it to be racist. A racially based decision may be founded, however, on ethicial preference, not unethical attribution of inferior status to non-preferred races. For in-
stance, a person’s choice to marry a partner of his or her own race may be based on the comfort of common culture and the wish for racially compatible children, not hostility to miscegenation or the belief that races other than one’s own are inferior. Similarly, the intention of a couple with a child of one sex to have

another child of the other sex is a sexual but not a sexist preference. To suppose that any such choice is necessarily sexist is unjust, and to base laws introducing criminal penalties on such a supposition where the evidence is that an assum-
tion of “a pro-male bias . . . appears to be unfounded” is both unjust and oppres-
sive.

Where social practice, including that to do with sex selection, is apparently sexist, such as in the environment to which the Indian legislation of 1994 is a response, the ethics of legal prohibition also warrant attention. Since “[f]eminist ethics demands that the effects of any decision on women’s lives be a feature of moral discussion and decision making,” and focuses “on the need to develop a moral analysis that fits the actual world in which we live,”14 legal prohibition may be examined in that light.

Until their society remedies its son preference, the prohibition of sex selection would seem predominantly to bur-
den women’s lives. It forces them to deliver sons, their husbands and families and religious demands that they deliver sons, they may have to bear successive pregnancies until they do. Early marriage and a quick succession of pregnancies contribute significantly to the risk of maternal mor-
tality and morbidity. A leading gynaec-
ologist has observed that “[e]very woman who gets pregnant is exposed to risk . . . . The risk increases in low resource settings . . . . Risks of pregnancy and childbirth recur with every preg-
nancy. The lifetime risk of pregnancy and childbirth depends on how many times the woman gets pregnant”.15 With-
out considering aggravated risks of ado-
lescent pregnancy, a World Health Organisa-
tion (WHO) report notes “the disturbing statistics of maternal mortal-
ty for developing countries, where women are more than 400 times as likely to die from complications during preg-
nancy than women in Southern Europe”.16 The risk to unplanned girl children is of early death due to infantici-
cide, malnutrition, or neglect.17

Son preference has produced, but might also mitigate, the sex-ratio imbalance. The latest Indian census puts the national sex ratio as 933 females to 1000 males, but only 927 females in the age group under six years old. In Haryana state, moreover, there are 861 girls to 1000 boys, and only 820 females in the under six age group.18 While ominous for the present generation of children, these figures offer a promise of future redress. If sons wish, as adults, to have their own sons, they need wives. The dearth of prospective parents want, and feel strongly about having, at least one child of each sex.1

whether or not this promise is real-
ised, attempts to end son preference by prohibition of sex selection are failing in India, and appear too peripheral on their own, to relieve sex bias, since “the tail cannot wag the dog”. Sex bias must be tackled at more fundamental and com-
prehensive social, economic, political, and legal levels. Prohibitions are unnec-
sary and oppressive where there is no sex bias but only a wish to balance a family with children of both sexes, and pose risks to women’s and girl children’s lives and health where bias remains.
