An ethical market in human organs

Charles A Erin, John Harris

While people’s lives continue to be put at risk by the dearth of organs available for transplantation, we must give urgent consideration to any option that may make up the shortfall. A market in organs from living donors is one such option. The market should be ethically supportable, and have built into it, for example, safeguards against wrongful exploitation. This can be accomplished by establishing a single purchaser system within a confined marketplace.

Statistics can be dehumanising. The following numbers, however, have more impact than most: as of 24th November, during 2002 in the United Kingdom, 667 people have donated organs, 2055 people have received transplants, and 5615 people are still awaiting transplants. 1 It is difficult to estimate how many people die prematurely for want of donor organs. “In the world as a whole there are an estimated 700 000 patients on dialysis . . . In India alone 100 000 new patients present with kidney failure each year” (few if any of whom are on dialysis and only 3000 of whom will receive transplants). Almost “three million Americans suffer from congestive heart failure . . . deaths related to this condition are estimated at 250 000 each year . . . 27 000 patients die annually from liver disease . . . In Western Europe as a whole 40 000 patients await a kidney but only . . . 10 000 kidney’s2 become available. Nobody knows how many people fail to make it onto the waiting lists and so disappear from the statistics. It is clear that loss of life, due in large measure to want of donor organs, is a major crisis, and a major scandal.

At its annual meeting in 1999, the British Medical Association voted overwhelmingly in favour of the UK moving to a system of presumed consent for organ donation,3 a proposed change in policy that the UK government immediately rejected.4 What else might we do to increase the supply of donor organs? At its annual meeting in 2002, the American Medical Association voted to encourage studies to determine whether financial incentives could increase the supply of organs from cadavers.5 In 1998, the International Forum for Transplant Ethics concluded that trade in organs should be regulated rather than banned.6 In 1994, we made a proposal in which we outlined possibly the only circumstances in which a market in donor organs could be achieved ethically, in a way that minimises the dangers normally envisaged for such a scheme.7 Now may be an appropriate time to revisit the idea of a market in donor organs.8 Our focus then, as now, is organs obtained from the living since creating a market in cadaver organs is uneconomic and is more likely to reduce supply than increase it and the chief reason for considering sale of organs is to improve availability.

To meet legitimate ethical and regulatory concerns, any commercial scheme must have built into it safeguards against wrongful exploitation and show concern for the vulnerable, as well as taking into account considerations of justice and equity. There is a lot of hypocrisy about the ethics of buying and selling organs and indeed other body products and services—for example, surrogacy and gametes. What it usually means is that everyone is paid but the donor. The surgeons and medical team are paid, the transplant coordinator does not go unremunerated, and the recipient receives an important benefit in kind. Only the unfortunate and heroic donor is supposed to put up with the insult of no reward, to add to the injury of the operation.

We would therefore propose a strictly regulated and highly ethical market in live donor organs and tissue. We should note that the risks of live donation are relatively low: “The approximate risks to the donor . . . are a short term morbidity of 20% and mortality, of 0.03% . . . The long term risks of developing renal failure are less well documented but appear to be no greater than for the normal population”9 And recent evidence suggests that living donor organ transplantation has an excellent prognosis, better than cadaver organ transplantation.10 Intuitively, the advantage also seems clear: the donor is very fit and healthy, while cadaver donors may well have been unfit and unhealthy, although this will not be true of many accident victims.

The bare bones of an ethical market would look like this: the market would be confined to a self-governing geopolitical area such as a nation state or indeed the European Union. Only citizens resident within the union or state could sell into the system and they and their families would be equally eligible to receive organs. Thus organ vendors would know they were contributing to a system which would benefit them and their families and friends since their chances of receiving an organ in case of need would be increased by the existence of the market. (If this were not the case the main justification for the market would be defeated.) There would be only one purchaser, an agency like the National Health Service (NHS), which would buy all organs and distribute according to some fair conception of medical priority. There would be no direct sales or purchases, no exploitation of low income countries and their populations (no buying in Turkey or India to sell in Harley Street). The organs would be tested for HIV, etc, their provenance known, and there would be strict controls and penalties to prevent abuse.

Prices would have to be high enough to attract people into the marketplace but dialysis, and other alternative care, does not come cheap. Sellers of organs would know they had saved a life and would be reasonably compensated for their
Debate

risk, time, and altruism, which would be undiminished by sale. We do not after all regard medicine as any the less a caring profession because doctors are paid. So long as thousands continue to die for want of donor organs we must urgently consider and implement ways of increasing the supply. A market of the sort outlined above is surely one method worthy of active and urgent consideration.

Is the sale of body parts wrong?

J Savulescu

In late August 2002, a general practitioner (GP) in London, Dr Bhagat Singh Makkar, 62, was struck off the medical register after he was discovered to have bragged to an undercover journalist about being able to obtain a kidney from a live donor in exchange for a fee. He told the journalist, who posed as the son of a patient with renal failure: “...
sell the means to that labour? If we should be allowed to risk damaging our body for pleasure (by smoking or skiing), why not for money which we will use to realise other goods in life? To ban a market in organs is, paradoxically, to constrain what people can do with their own lives.

Think about a couple with two young children who are contemplating buying a house. They find one for $150,000, but in a heavily polluted and unsafe area. They could spend another $50,000 and live in a cleaner, safer area. But they decide to save the money and expose their children to a greater risk in order to pay for private education.

Or consider the diver. He takes on a job as a deep sea diver which pays him an extra $30,000 because the job has higher risks to his life and health. He takes the job because he likes holidays in expensive exotic locations.

In both these cases, people take risks for money. They judge that the benefits for their own lives or their family's outweigh the risks. To prevent them making these decisions is to judge that they are unable to make a decision about what is best for their own lives. It is paternalism in its worst form.

There are two crucial issues. Firstly, we need to ensure that the risk involved is reasonable compared with the benefits it will offer to the person undertaking the risk and society. Secondly, people need to be fully informed and to give their consent freely. By “freely”, I mean that they need to give their consent without coercion, exploitation, shoddy standards, or injury for the chance to improve the quality of their lives or of their children's lives or for anything else they value. Money for these people is just a means to realise what they value in life. Whether or not a private market in organs will increase supply or improve its quality, it seems that people have a right to sell them.

CONTROVERSY
Commentary. An ethical market in human organs

J Radcliffe Richards

This paper offers a positive suggestion for the management of a market in organs for transplant; and in doing so provides a useful opportunity for clarifying the structure of the Great Organ Sales Debate.

The issue is in constant need of clarification, because it is usually aired as a political question of the For and Against variety: should organ selling be legal or not? This format usually encourages protagonists to collect into an unsorted heap whatever arguments look as though they might have any persuasive force on their side, and because people may be on the same political side for different moral reasons, or have the same moral principles but reach different political conclusions, the political arguments tend to obscure both the real issues and the logical structure of the controversy.

Although attitudes to organ selling seem to have relaxed somewhat since the subject first came to light about a dozen years ago, most professional and political opinion is still against it. But what is the moral basis of this opposition? If you think organ selling should remain illegal, what exactly is your reason? Is it that you regard selling body parts as wrong in itself, irrespective of consequences? Or is it because you think that although it is not wrong in itself, in practice the harms will usually or always outweigh the benefits? Either of these quite different views might support the same political conclusion.

In practice, it is not clear that many opponents of organ selling have ever recognised the distinction. Most of the individual arguments are of a kind that implies the second view, because they are about anticipated harms of allowing the practice: coercion, exploitation, shoddy standards,
Debate

itself you are into the terrain of highly complex
venting these harms. They also recognise that
recognise that there is a prima facie case for
proposals should be understood. The authors
keep the good. When possible dangers of organ
aim for controls that will minimise the bad but
avoiding the harm while keeping the good. This
in itself you may well embrace all suggestions of
dangers and difficulties with relief, because they
seem to strengthen the political case for prohibi-
tion. But if you start with the idea that what mat-
ters is to weigh harms and benefits, and that there
is a prima facie case for allowing transactions that
can save the life of purchasers and give vendors
something they value more than their kidney, you
will look at the objections raised in quite a differ-
ent way.

In the first place you will look at them critically,
rather than rushing to accept them—and will
soon find that a good many have no force at all,
because they involve logical fallacies or invented
facts. And then, when you find real dangers and
difficulties, you will try to devise techniques for
avoiding the harm while keeping the good. This
is, after all, what we automatically do in other
contexts. The existence of rogue builders and
medical quacks does not lead us to try to stop
building or medicine altogether: obviously, we
aim for controls that will minimise the bad but
keep the good. (When possible dangers of organ
selling are treated as objections to the whole idea,
rather than as problems to be overcome if
possible, that is further evidence that they are not
the real objection.)

It is in this context that the Erin and Harris
proposal should be understood. The authors
recognise that there is a prima facie case for
allowing organ sales, but they also recognise that
a totally free market could do a great deal of
harm. What they propose, therefore, is a restricted
market, designed to allow the benefits while pre-
venting these harms.

So how good a proposal is it? Once you get
beyond the idea that organ selling is wrong in itself, you are into the terrain of highly complex
empirical questions, and there is no point in phil-
osophers’s (or anyone’s) engaging in armchair speculation about them. Recognition of how this
proposal fits into the debate as a whole does sug-
gest, however, the kinds of question that should be
raised about it.

If it is presumptively bad to prevent sales alto-
gether, because lives will be lost and adults
deprived of an option some would choose if they
could, it is for the same reason presumptively bad
to restrict the selling of organs. Once you recognise
that the default presumption is in favour of any
such transaction, you should be reluctant to pre-
vent any more sales than necessary. The Erin and
Harris proposal, if viewed as representing the only
circumstances in which buying and selling should
be allowed, is restrictive in many ways. Is there
good enough reason for ruling out the many
potential sales it would prevent? Here are one or
two questions about it.

For instance, the idea of achieving equity of
distribution by limiting purchases to public
bodies, is obviously attractive. But in countries
where there is nothing such, or where it is gen-
erally accepted (as here) that people who find the
public service inadequate to their needs should be
allowed to go outside it, is there any justification
for providing special restrictions on the freedom
to make private arrangements to find a kidney? It
would probably be best to have public bodies that
supplied all needs—but until all needs are
supplied in this way, is there any good reason to
prevent (properly controlled) private arrange-
ments?

And how good is the justification for keeping
the market within a “self-governing geopolitical
area”? Of course there is something undesirable
about a one way international traffic from poor to
rich; but that is not enough to settle the all-things-considered question of whether it
should be allowed. Much international trade is
currently objectionable on the same grounds, but
simply stopping it would be worse for the poor
countries. It is much better, for them, to improve
the conditions of trade than to prevent it
altogether. Is the case different with organs?

These questions are not intended as rhetorical:
they may have answers. Or even if they have not,
perhaps the proposal is restricted to give it greater
chance of political success. But the matter does
need to be checked. It is clear that strong feelings
against organ selling colour every aspect of the
debate, giving apparent weight to arguments
whose inadequacy nobody could miss in neutral
circumstances. Could such feelings be influencing
even this proposal, making it more restrictive
than it should be? Whatever the answer, it is
morally essential to ask the question.

Janet Radcliffe Richards on our modest proposal

Charles A Erin, John Harris

Janet Radcliffe Richards is as always to the point and radical. We agree with her that “if it is presumptively bad to prevent sales altogether because lives will be lost...it is for the same reason presumptively bad to restrict the selling of organs”. Her complaint against our paper is that we are unnecessarily restrictive. John Harris indeed has argued that there are no sound ethical or philosophical reasons for objecting on principle to the sale of live tissue and organs. If a scheme can be devised which meets most of the objections standardly brought against organ sales, however, then even though it is more restrictive than alternatives and even if the objections that it meets are themselves unsound, it may have a great deal to recommend it. And of course the main thing it has to recommend it is that the sooner a consensus can be achieved for permitting sales (even on our highly regulated model) the sooner we begin saving more lives. If we keep our “eyes on the prize” we will advocate the scheme most likely to succeed even if a more radical scheme is theoretically justifiable.

Thus when Radcliffe Richards says: “Of course there is something undesirable about a one way international traffic from poor to rich; but that is not enough to settle the all things considered question of whether it should be allowed” she is again right. It is not enough to settle that question. Our paper was not trying to settle that question. We have proposed a scheme that would maximise organ sales by meeting the most common and persistent objections to commerce in body parts. In our paper we note that: “In 1994, we made a proposal in which we outlined possibly the only circumstances in which a market in donor organs could be achieved ethically, and in a way that minimises the dangers normally envisaged for such a scheme” and this is the proposal that we repeat in abbreviated form. The claim we make, which it seems Radcliffe Richards judges to be too strong, is that our proposal outlines “possibly the only circumstances in which a market in donor organs could be achieved ethically”; but note that there is a qualification to this claim, namely that if the first part of our claim is true it is so because it defends organ sales “in a way that minimises the dangers normally envisaged for such a scheme”. It may be that organ sales could be defended (possibly by Janet Radcliffe Richards and for that matter by the present authors) in a way that does not minimise such dangers. But that is not what we were trying to do in our paper.
