Feeling Good and Doing Better: Ethics and Non-therapeutic Drug Use

This is a book about non-therapeutic use of drugs, drugs for pleasure and drugs for enhancing performance, drugs like cannabis, heroin, cocaine, amphetamines and anabolic steroids. Its central theme is that our society has adopted an inconsistent, paternalistic and often unethical attitude towards drug-taking and has criminalised it in a way which contributes greatly to the harm that it does. The case is made that we should review the present situation, adopt a more humanitarian attitude, develop social rather than strictly legal controls and ultimately if need be change the law.

But this is too simple a summary, for the book is detailed in its approach and its several chapters examine a number of aspects, political, philosophical, social, legal, medical as well as purely practical, in great depth. The contributions by the twelve authors are erudite, compassionate and, I thought, beautifully presented. I particularly enjoyed the chapters by the three editors themselves, the introduction by William Gaylin which sets the scene and presents the problems, the discussion by Thomas Murray on drug use in sport and the final summary by Ruth Macklin proposing inter alia some new-look social attitudes. But there is also an interesting chapter by James Bakalar and Lester Grinspoon on social attitudes to risk-taking and, for medical readers, a fascinating discussion by Nancy Rhoden on the psychiatric patient’s rights to refuse psychotropic medication and an analogy with the healthy individual’s rights to take mind-bending drugs.

Many questions remain to be answered. Why, for example, do we take the unwavering view that drug-taking for pleasure or enhancement is wrong and must be prevented? Is it because of the dangers involved? Not solely, because inherently more dangerous pursuits like riding motorcycles are condoned and some, like climbing Mount Everest...
encouraged. In sport, is it because we regard the use of drugs as cheating? Surely not, for other 'cheating' manoeuvres such as blood-doping and training visits to training centres at high altitude, for those who can afford to go, are acceptable. Is it because it advances no social value? In a liberal society every individual has a right to privacy – it is formulated in the American constitution and its amendments – which might be seen, at least within limits, to deny the compulsion for such advancement. These and many other matters are discussed in this book.

Some features of the present situation urgently need our attention. We maintain an unacceptable two-faced political attitude to drug-taking. On the one hand we allow and profit from consumption of alcohol and tobacco; on the other we prohibit cannabis, heroin and the rest. Morally as well as ethically this is both illogical and lamentable. Even now in the throes of an epidemic of narcotic abuse still the harm done by socially acceptable drugs prevails. Certainly social attitudes are changing and there are some signs that the prevalence of the smoking habit will decline. Can we afford to be more liberal in our attitude to the remainder? I believe we must reject the simple pragmatic solution offered by one of the authors; namely that the State cannot effectively control the drug scene, therefore it should give up trying, make appropriate allowances and thereby free the police for more worthwhile pursuits. The fact is that drug-taking is inherently coercive to others, not only to athletes as asserted by Thomas Murray in his chapter, but to us all and especially to the very young, to the ill-informed and to the mentally incapable. To this extent drug abuse is a communicable disease.

There are obviously no straightforward legal solutions. Social attitudes must change: in the final words of Ruth Macklin '... it would be a decidedly rational step in a more socially desirable and morally acceptable direction.' This is a book to be read, enjoyed and contemplated.

**What is to be Done about Illness and Health? – Crisis In The Eighties**

This is a book which will excite strong emotions in its medical if not its lay readers.

The first section looks at the social causes of disease. A series of interviews provide a moving image of the health problems of ordinary people in the inner city. The strains of working where productivity matters more than people; the feelings of powerlessness which arise when confronting massive bureaucracies, including the health service; and the complex interactions of poor housing, exploitative jobs and poverty are vividly portrayed.

This human aspect is underpinned by a brief presentation of the epidemiological data linking poverty with ill health. The result is a blending of *Inside the Inner City* and the Black report, which makes its point strongly and uncompromisingly. Better health is not merely a matter of more money for the National Health Service (NHS); it requires a questioning of how people are forced to live and of placing profits before people.

Unfortunately, the second and third sections of the book, which consider the present role of the health service and how thing could be organised better, fail to maintain the same high standard. The dehumanisation when hospital patients are treated as cases and not as people; the irony of running a hospital as a 'health-care factory' which exploits its workers and promotes their ill-health just as any other profit-oriented factory; and the contrast between the glamour of high technology medicine and the real human needs of the chronically sick and disabled are important points. The discussion of what medicine can and cannot offer society is sane and well balanced. However, though many important criticisms of the way in which the health service operates are made, and the limitations of medicine pointed out, there is a lack of factual support or logical argument for the criticisms made. The use of individual cases to make points, rather than to illustrate points supported by data, gives those who wish to the chance to dismiss the case cited as unrepresentative of the general situation. An irritation is the use of a nebulous 'we' without any clear antecedent in many unsupported assertions, which creates a tone of peevish aggressive moral superiority.

'We were told we were entering the era of unproblematical contraception. Who was? By whom?'

As a general practitioner, I felt the treatment of primary care was far too superficial and sketchy. Perhaps because I am a white male doctor I thought the decision to place all the blame for medical hubris on doctors was simplistic. I would have welcomed a discussion of why society colludes in attributing to doctors powers they do not have, and in seeking miracle cures where there are none. The role of the media in this process, and people's need to control problems by medicalisation, are ignored. The doctor-blaming also meant that the oppression of junior hospital doctors, with their 104-hour week and its implications for patient care, was ignored. I found the assumption that there exists an angry, working-class, health-consciousness in anything other than an inchoate form unconvincing, and would have welcomed more consideration of how such a consciousness could be helped to develop and organise.

The concluding consideration of possible better systems of care is rather sketchy and uncertain. The alternative ways of working which are being tried are hinted at rather than discussed, and in the final chapter an apocalyptic vision of a possible socialist health centre is extremely thinly drawn.

This book approaches questions which are vital for anyone who is unhappy with the present state of society and of the health service – which surely all thoughtful people are. In spite of its dogmatic assertions and some lack of factual support, the validity of its basic case should not be dismissed.
