Social choices of technology–whether: to build a modern society risks almost all result from chance, and devastating weather. In contrast, in such as crop failure; famine; flooding; pestilence; and social and economic factors. All risks are natural disasters, Acts of God, not classification but rhetoric.

Our concern about safety and aversion to risk. This is where the “emotional factors” include: concern for the public to assert its voice, its values, and its expertise, as well as, and against, the well-articulated voice, values, and expertise of the biotechnology companies.

This third edition of O’Rourke and Boyle’s Medical Ethics: Sources of Catholic Teaching is a useful and comprehensive collection of statements published, for the most part, by the central authorities of the Roman Catholic Church, the National Conference of Catholic Bishops in the United States and the bishops’ conferences of individual US states on a wide range of issues in the area of medical ethics. The statements are arranged alphabetically according to subject matter. It is useful to have such a wide range of documents available in one volume, many of which would otherwise be accessible only with difficulty. The documents included range from major encyclical letters issued by more recent popes on matters that can be seen as condoning unethical behaviour. Taken to the extreme the “Universal School” may result in no potentially useful research being done in the developed world because of the fear of any harm. The local self-determination group can, however, fail into the dangers inherent in having varying standards and therefore lead individual bishops to very particular questions with which they have been faced, and upon which they have felt the need to offer some guidance. Unfortunately no guidance is provided as to the weight and authority that is to be given to the various documents. For example, a major philosophical and theological treatise such as the encyclical letter, Evangelium Vitae, by John Paul II is presented alongside an ad hoc response from the bishops’ conference of an individual state to a particular question that has arisen, as though they were of equal significance and importance. This detracts seriously from the usefulness of the collection and gives a misleading weight and authority to a great many of the statements gathered together here.

The impression could also be given that documents such as these provide the only, or indeed the major, source for Catholic teaching on the area of medical ethics, whereas of far greater significance and abiding value are the contributions to this field of medical ethics of authors such as the late Richard McCormick, John Paris, and Albert Jonsen, to name but a few of the more prominent.

The Ethics of Clinical Research in Developing Countries

The discussion paper produced and published by the Nuffield Council on Bioethics about the ethics of clinical research in developing countries is a timely, useful and (for such a concise publication) comprehensive document. It will prove useful for those planning research in developing countries, as well as for those already working in the developing world and planning research. The sponsors of research should also read the paper, whether they are pharmaceutical companies or a host country’s statutory bodies, reviewing research proposals. The topic has most recently been discussed in the context of the controversy surrounding trials of zidovudine (AZT), but the authors rightly point to a much wider agenda. They also convincingly highlight the differences and difficulties that are particular to research by developed countries in developing countries (rather than those inherent in all research). They also touch, however, on the issue of self-generated research in the developing world.

Perhaps the general issue can most easily be summarised in terms of the competing arguments for universality in the ethics covering medical research (which can be seen as condoning paternalism from the developed world), and for acknowledging the need for local self determination (which can be seen as condoning unethical behaviour). Taken to the extreme the “Universal School” may result in no potentially useful research being done in the developed world because of the fear of any harm. The local self determination group can, however, fail into the dangers inherent in having varying standards and therefore lead individual bishops to very particular questions with which they have been faced, and upon which they have felt the need to offer some guidance. Unfortunately no guidance is provided as to the weight and authority that is to be given to the various documents. M O’Dowd
to the developing world being exploited by the richer and more powerful North.

More broadly, it is possible to see this branch of ethics as a subset of the overall ethics associated with development, underdevelopment and poverty. Many of the special dilemmas in the context of appropriate standards of care arise directly from poverty and inequality. For example, those who argue for developed world standards of care for all trial participants, will need to ask if this medical care should continue to be provided, even when the underlying cause of the condition is malnutrition. Should one then provide developed world standards of food, the local food infrastructure and so on.

The paper covers the existing guidance and the dilemmas, contradictions, and problems they pose in their application. It also covers the issues of non-therapeutic research, consent and concern for those who remain after a trial is over.

Not surprisingly in such a paper, there are more questions than answers. The authors do, however, point to one very good example of practical guidance that the guidelines can provide. This is where pro-active guidance (unfortunately provisional and therefore un-referenced) is being provided in the form of a document on ethical considerations in international trials of HIV preventive vaccines by the Joint United Nations Programme on HIV/AIDS (UNAIDS). Perhaps the future lies in the production of appropriate intermediate guidance and training, in a minimum set of ethical issues and practical considerations that should be addressed before research is started. This may enable a compromise to be reached between some of the impracticalities and dangers in applying developed world standards and developing universal standards. This paper is a very useful start in identifying the issues and indicating a way forward.

The Ethics of Health Care Rationing: Principles and Practices

This book is about scarcity and rationing in health care and the ethical questions they raise. It is based on the premise that if the aim of a responsible government is to balance the nation’s varied claims upon the collective purse, then no government can be morally blamed for failing to remove the need of rationing from the National Health Service (NHS), and thus rationing as such cannot give rise to legitimate moral concerns. The question that needs to be addressed therefore is not whether rationing itself is unethical, or even whether any particular distribution mechanisms are unethical, but whether they are structured and work in morally acceptable ways, and lead to morally acceptable results.

In the first chapter Butler describes the gap between needs and resources. He describes what has been done (mainly) in the UK as a way of providing the background to the rationing debate. The second chapter addresses the moral basis of rationing by focusing on how which personal qualities we are prepared to accept as a fair basis for discriminating between individual patients. The author could not have chosen a simpler and yet more effective example to drive us through the debate.

Chapters 3 to 5 tackle the debate on rationing from a different point of view. Here Butler explores the moral issues of fairness and justice through the structures, processes, and outcomes of health care. Given that health services will always be in short supply in relation to potential demand, he asks whether they are structured and organised in ways that will promote people’s fair and equitable access to health care. This question is addressed by taking the reader through three competing theories of justice: those of Rawls (social justice), Daniels (fair equality and opportunity), and Doyal (human need). All three share a common feature in highlighting that the structure and provision of health care cannot be left to chance or interest but must be planned and implemented in ways that make explicit the principle of justice they are seeking to achieve.

Butler then takes the reader through the various processes of health care. Starting with a description of Waele’s theory of responsible or responsive government, he presents numerous arguments and examples of implicit and explicit rationing, public involve ment in, and political and professional ac countability for, rationing decisions, pointing out the potential conflicts between different moral concerns at different levels. Clinicians have a primary obligation to treat the individual patients before them, managers to see that public resources are not wasted, and politicians to use the nation’s resources fairly and to balance interests and expectations of different sections of society. Within a given budget constraint, are government and health authority decisions made on the basis of defensible ethical criteria? Even between different doctors and nurses are unable to do all they would like to do for their patients, are they making choices based on established ethical criteria?

Chapter 5 addresses the ethical issues of health care rationing and health outcomes. As Butler states, outcomes are elusive things. Even at the patient level measuring improvements in health may be tricky, but at population level, where ethical questions are more likely to be posed, the difficulties multiply. Moreover, improvements in health are likely to reflect a variety of social, economic, environmental, educational, and occupational changes among which delivery of care is only one. In situations where all objectives cannot be achieved and comparisons between different outcomes have to be made, how can we fairly establish that some objectives are morally to be preferred to others? Should outcomes be perceived in terms of meeting individual need, the maximisation of total health gain (utilitarianism for example, using quality adjusted life years) or as the narrowing of the health gap between rich and poor?

Chapter 6 singles out this book from others on the topic. This chapter contains a series of stories the author has gathered from professionals who deliver health care. In order to present an unbiased selection of stories, Butler’s includes anecdotes from doctors, clinicians, nurses, and managers. Despite their different jobs, the story conveys a common thread in that although none say so openly, each clearly describes a decision which implies rationing. These stories clearly bring out the conflict between moral concerns at the different levels.

From a professional point of view this book works well. It manages to balance, on the one hand, strong arguments for advancing knowledge in science and anthropology, and on the other, the interests of indigenous peoples in respecting ancestors.

The discussion of organ transplantation policies and the incipient ethical dilemmas of new technologies is generally solid, but occasionally fails to accommodate the full range of opinions. Given the broad remit of the field, Jones does well to cover the many theoretical situations which may be expected.

In discussing brain death, Speaking for the Dead reintroduces the perspective of the cadaver, the person he or she was previously, and other stakeholders. These viewpoints, in defining brain death, frequently become subaltern to technical neurophysiology and philosophical argument about personhood, selfhood and consciousness. Jones makes more action guiding points, and thus his discussion is more clinically relevant than most other debates about brain death.

Finally, Jones expounds on his particular expertise, embryology, and specifically addresses brain birth. His arguments are based upon careful study and are highly pertinent. I hope they will be heeded.
Three chapters, for example, proffer a thought-provoking, trichotomy of views concerning the singular question: who should control the scope and nature of medical ethics? Several chapters examine the relevance and adequacy of the traditional paradigm of codified, collaborative medical ethics in the context of particular, contemporary challenges to American medical ethics, relating, for instance, to “alternative medicine”, managed care, population health, and the challenge of providing universal access to health care, given limited resources.

The lengthy time continuum of the volume encompasses forward-looking comments on future challenges to traditional medical ethics, involving, for example, molecular medicine. Given the uncertain role of ethics in the unfolding genetics revolution, it cannot be gainsaid that it is timely and potentially salutary to ponder, in an informed intellectual sense, whether codified ethics can favourably help guide the future of biomedicine. The recondite nature of this volume is well tailored to suit the curiosity of academically inclined readers interested in medical ethics, particularly those in America. Its abstruseness, however, is ill tailored to fit the lay reader, and may even fall outside the ken of comfort of some clinicians. In this respect, the volume is ineffectual as an educational conduit for the possible linkage of professional ethics with broader societal ethics.

Withal, the volume indubitably is a beacon of superb scholarship, illumining the path to moral rectitude, and barriers along the way, for academicians.

L Uzych

Gene Therapy and Ethics

Gene therapy research and its clinical application raise a large number of ethical, legal, and social questions. Many of these are discussed in Nordgren’s anthology. The contributions come from a number of different disciplines, including bioethics, genetics, social science, and theology. The book is divided into five main sections (following a short introduction): scientific aspects of gene therapy; the history of, and prospects for, gene therapy; conceptual issues; gene therapy in a German and Japanese context; and a section on the uses of gene therapy in relation to, for example, testing and screening. The contributions are quite diverse and mostly well worth reading. From the perspective of medical ethics the contributions by LeRoy Walters, Eric Juengst, Karen Lebacqz, Nikolaus Knopffler, and Christian Munthe are of particular interest.

Walters’s contribution focuses in part on the issue of eugenics. He defends a voluntary germ-line gene therapy programme as a means of reducing the transmission of genetic diseases to future generations. In the context of these chapters on genetic interventions, in terms of targeted diseases or deviations, between past eugenic programmes and the sort of germ-line genetic intervention programmes that would probably be run today, Walters also discusses the difference between gene therapy and genetic enhancement. He thinks the distinction is vague. Eric Juengst undertakes the task of clarifying the distinction, discussing three accounts of it. These appeal to the goals of medicine, the notion of species-typical functioning and particular concepts of disease, respectively. Juengst argues persuasively that none of these distinctions bear moral weight. For instance, he points out that there are cases of medical treatment leading to above-species-typical functioning that seem obviously morally desirable (for example the use of gene therapy to empower the immune system to eliminate cancer cells). Juengst, however, is not uncritical of genetic enhancement and there are some compelling reasons to worry about his concern that genetic enhancement should not involve complicity with unjust social biases and Lebacqz’s views.

Lebacqz argues that the concept of therapy presupposes a distinction between medical intervention for normal and abnormal. How that distinction is drawn often depends on power structures in society and, hence, is not necessarily based on whether being unusual in some particular respect makes one worse off. Among other things, genetic therapy which targets perceived abnormalities, such as dwarfism, may not benefit anyone. It may simply make people more alike. Lebacqz suggests that if disability is a moral problem, then it is not society, but rather the reactions to people who differ from the “genetic norm” that needs to be changed, not the differing individuals. It is not clear why this should be thought to follow. In our society inability to read is, let us suppose, a socially constructed disability. Suppose we could make everyone read using moderate resources, and that a society in which inability to read was not a disability would be in many respects much worse than ours. Why should we prefer, morally speaking, the latter option? The more general point is that it is unclear why, from the point of view of justice, a society in which people are disabled in many respects would be preferable to a society in which each of us is well off to the same extent but there is less human heterogeneity.

In his contribution, Nikolaus Knopffler embraces the Kantian idea of human dignity, and treats it as the fundamental principle of bioethics. Roughly, in his view this idea implies that, whereas somatic gene therapy is morally unproblematic, germ-line gene therapy and germ-line enhancement are morally unacceptable. Knopffler does not explain why, exactly, this follows. At one point he seems to suggest that the fact that we have no common grounds for determining which enhancements are desirable implies that enhancement violates the Kantian principle, but such irresolvable disagreements simply seem beside the point.

In an interesting article, Christian Munthe convincingly argues that there is no morally relevant difference between genetic interventions involving the treatment of a particular individual and genetic interventions involving the exchange of one good for another. Examples of the latter sort of intervention include the preselection of embryos based on preimplantation genetic diagnosis.

K Lippert-Rasmussen

Creating Accepting Communities
S Dunn. MIND (National Association for Mental Health), 1999, £9.99 (£1 p+p), pp 181. ISBN 1874690871

The government’s social exclusion unit (SEU) was established to help individuals, groups, and regions overcome deprivation and discrimination resulting from a combination of problems, including unemployment, poor
quality housing, low income, lack of educational training opportunities, bad health, and family breakdown. Such difficulties are commonly experienced by people with mental health problems who also have to cope in a society which alienates and rejects them, barring them from every aspect of community life. Remarkably, even the SEU’s remit excludes consideration of the obstacles to social inclusion faced by those with a psychiatric diagnosis.

Creating Accepting Communities is the final report of an inquiry commissioned by MIND, which looked at the nature and extent of social exclusion experienced by people who use mental health services in Britain. The inquiry panel received written and oral evidence from a wide range of individuals and organisations, including mental health practitioners, high street retailers, groups working within the voluntary sector, and, importantly, service users.

The book is clearly written and the material well organised into four main chapters, each of which offers a useful summary of the key issues raised. Quotations from witnesses are used extensively throughout the narrative, giving real meaning to the findings, and to participants a sense of “ownership” in the report.

The first chapter summarises evidence presented to the inquiry on how a psychiatric diagnosis can exclude people from a range of social opportunities in significant areas such as employment, education and training, aspects of daily life (that is, access to goods and services, social networks, etc), and empowerment within mental health services. The panel found widespread evidence of social exclusion and dismissed claims that this was simply the result of poverty. Instead, they argue that while policy initiatives should focus on addressing the material circumstances of service users, they should also work towards creating greater social cohesion or social inclusion.

A range of ethical aspects associated with social inclusion is briefly but coherently discussed in chapter 2. In particular, inquiry evidence is used to evaluate the relationship between individuals and their wider community, and to address the following questions: how do societies judge the value of a person? How does society differentiate individual “badness” from “mental illness”? How should risk be defined? What is meant by the participation and empowerment of service users? Essentially, the findings support the basic need to recognise the absolute value of individuals and to acknowledge that any ethical approach to social inclusion needs to balance this against existing social forces: differences can only be resolved through the participation of everyone involved.

Chapter 3 discusses a range of initiatives that have been set up to promote social inclusivity in key areas of work, education, the arts and the media, daily living, and the mental health services. The panel highlighted three areas where more work should be done to improve social inclusion: the development of more initiatives based on inter-agency cooperation, legal and policy-based reforms at national level and the promotion of more intensive public education programmes on mental health. Based on this inquiry evidence, chapter 4 presents a series of recommendations aimed at directing social progress “from exclusion to cohesion”.

In general, the report raises the profile of a wide range of issues concerning social exclusion and provides an informative overview of current policy and practice initiatives. Unfortunately, because the book’s remit is so wide, its depth of analysis is compromised, leaving unchallenged some very difficult ethical barri ers to social inclusion.

For example, little is currently known about the nature of the interactions between “us and them” and the consequences of these interactions for the promotion of a society based on “inclusive diversity”, particularly in the face of: 1) growing public demands for more zero tolerance initiatives; 2) the threat of new legislation designed to exclude those with a serious personality disorder, those who fail to comply with medication while living in the community and those who are disruptive in schools; 3) media campaigns provoking street demonstrations against groups the media feels society should no longer tolerate, and 4) employment practices which measure individual value in terms of productivity to the point whereby even mental health services lack confidence in service users’ abilities.

Ultimately, the problem of analytical depth is a methodological one that requires the development and integration of research initiatives at both the micro and macro levels of social inquiry. Moreover, these observations should not detract from what is an excellent report and an important reference point for anyone interested in achieving the social inclusion of people who experience mental ill health.

A Colombo

Priority Setting and the Public

As it suggests this book’s main area of inquiry is the rationale for, and methodology of, public involvement in priority setting. Mullen and Spurgeon set out to evaluate a number of assumptions and hard issues in priority setting. In doing so they have produced a volume that is both a useful introduction to this area and a worthy piece of research on an important theme.

They begin by contextualising the debate about priority setting within the recent history of health system reform in the UK and other nations. This move enables them to give an analysis of considerable scope. They are not just interested in rationing and public involvement but also in questions about the level to which the UK National Health Service (NHS) ought to be publicly funded. Given the frequently stated assumption that rationing is inevitable it is very refreshing to read a book that grapples with the difficult, mor primary question of whether rationing itself is in fact necessary.

They note that reform processes and initiatives in the health system have served to focus attention on the need for priority setting but that there is a need to evaluate carefully the basis of this need. The present level of funding that the NHS receives is a matter of choice and not simply a matter of economic necessity, as is frequently implied. They suggest that we should think carefully about the inevitability of rationing and our inability to pay and instead work out how to provide treatments that are of undisputed efficacy.

In chapter three they examine the basis for public involvement in priority setting. Given that many would think that public involvement in the setting of priorities is a good thing they ask the pertinent question, whether such involvement would result in the optimum set of priorities and consider whether it may risk a “dictatorship of the uninformed” (page 34). Other key difficulties addressed are the problem of finding a group that can be considered representative.

In chapter four they survey the traditional approaches to priority setting. This includes a detailed section on QALYs and the standard objections to them. This chapter contains an interesting section on how the rule of rescue can conflict with the maximisation of health care gain that is associated with QALYs (pages 44–45). They cite the Jayme Bowen case as an example of the depth of feeling that can be evoked when the rule of rescue conflicts with the maximisation of health care benefit.

Their sixth chapter considers in some depth empirical methods that can be used to elicit the values of the public about priority setting. They present a broad range of possible methods in a way that makes them useful, not only for ascertaining views about prioritisation but also for gaining information about other empirical questions within medical ethics.

Given the amount of literature on this topic it is inevitable that some issues are dealt with in a fairly summary fashion, but when they do this the authors make reference to the wider literature.

All those interested in prioritisation and the NHS ought to read this book. It’s likely to be of special interest to those making prioritisation decisions at all levels.

J McMillon

Catholic Ethicists on HIV/AIDS Prevention

This impressive and informative book deserves a wider readership than it is likely to get. Unfortunately there are still too many people who consider they have no need to read anything about the virus as it will, to their way of thinking, never touch them. In addition there will be those who think that a volume by Catholic ethicists will be too narrow in outlook to be worthwhile. Both sets of people are mistaken.

There is no cure nor is there likely to be and sooner or later it will affect, let alone infect, millions across the world. On the second count readers will be surprised and energised by the clear and honest debate concerning the teachings of the Catholic Church.

The first and longest section is made up of a series of case studies ranging from needle exchange in Puerto Rico, to confronting social stigma in Uganda, and matters relating to confidentiality in Australia. The second consists of seven chapters covering fundamental moral issues for HIV prevention; the chapter by Lisa Cahill (Boston, USA) on AIDS, justice and the common good and the one by Paulinus Odozor (Attakuru, Nigeria) on Casuistry and AIDS, are particularly worthwhile. Kevin Kelly (Liverpool, UK) provides the conclusion.

The most obvious moral issues are those surrounding the use of condoms but they are not the only ones. What if an infected person refuses to tell his or her partner of their status? Is any duty incumbent on the doctor treating
the positive person to inform the partner? Where does confidentiality begin and end? One of the saddest cases, and not as rare as it may seem, is of a married couple in Italy, both infected, who want to have a child. Will the child also be seropositive? Will one or both parents live long enough to look after the child? Who else should know of the situation?

The Catholic Church has always had high ideals even if many of its adherents, including some in positions of power and authority, have not lived up to them. Those ideals cover not just areas of chastity and fidelity but also those of charity and truth where each one of us has to strive constantly to live up to a more responsible life. The church has particularly strong teaching on fidelity in marriage and against premarital and extramarital sex. It is important to recognise the connection between this strong teaching and the basic values of family life and the worth of the individual, on the one hand and, on the other, the abuses that arise from pressures on innocent girls and women, particularly in some cultures. A universal approval of condon use would be an end to greater ills and diseases. How can we work towards the time when married couples have sufficient education and knowledge to work out for themselves the right use of conscience with regard to their sex life?s and in the model that there are exceptions when a solution is far from obvious: we have to remind ourselves frequently that we are fallible human beings with free will. This book gives a long way towards enabling the reader to consider and ponder at some considerable depth, a variety of dilemmas and questions.

In so many countries, including our own, a conspiracy of silence, of denial, has grown up in relation to HIV and AIDS. It is only when HIV is looked at objectively and dispassionately, regardless of the moral stigma that so often haunts those affected by the virus, that the real work of prevention will occur. Educating the schools is a favourite tool. Only when we understand what the virus is, how it is passed on, what it does to individuals and to families—not least the children—will the global epidemic begin to be contained. Just to know that on average 5,500 funerals take place each day in Africa as a result of HIV should go a long way towards impressing upon us what the consequences in terms of personal tragedy and economic structures are in that continent alone. The rapid spread of the virus in India, passed off as “a bad illness”, resulting from infidelity and prostitution, as well as from untreated blood products, gives cause for alarm. “It won’t go away” remains an all too common remark, betraying a total lack of awareness of just how many people are now suffering from this virus, either in themselves or in those they love. This book should be widely read and used for discussion and reflection on just how far each one of us has a responsibility for others in this desperately needed world. In our multicultural medical practices all doctors need to be more aware of HIV and its consequences.

D Bell

From Chance to Choice: Genetics and Justice

A Buchanan, D W Brock, N Daniels, et al.

With over 10 000 bases of DNA being sequenced around the world per minute, it is vital that ethical discussion continues to keep pace with genetic research. This contribution by four top theorists in bioethics carefully considers the implications of the many ways genetic information will influence human health and reproduction, by considering “the most basic moral principles that would guide public policy and individual choice concerning the use of genetic options in a just and humane society” (pages 4–5).

Proceeding with the themes of rights, justice, and harm, problems addressed by the authors include: the significance of the moral difference between treating genetic disease and altering personality characteristics; whether the utilisation of prenatal interventions to avoid disability discriminates against the disabled; and who should have control over the utilisation of this technology.

The main focus of the work is upon the future of genetics, however this is framed within an “ethical armour” of eugenics, in which the inappropriateness of past practices is considered. It is argued that the wrongs of eugenics (broadly, a denial of freedom) must be recognised when considering what an ethical approach to genetic technology might constitute, before moving to questions of how we might go about providing future generations with genes that could contribute to their lives going better is not necessarily unpalatable. It is vital, however, that any such procedures are pursued justly and carefully.

After moving through several topical themes in genetics (which are highlighted in the introduction by the presentation of several futurist geneticists’ views), three final chapters of the book draw out the major principles that should be used in policy-making about genetic technology.

Among the arguments advanced throughout are claims that gene and genetic interventions are required, that it is possible to use genetic technology effectively and at what price to individuals at risk. Another effect of this obligations to those who are worse-off, and for plurality in views of personal autonomy. These arguments are theoretically applied to non-therapeutic procedures, and in doing so, are preferable to the use of genetic interventions in a just perspective for the distribution of genetic risks and benefits. Another benefit of this is for social institutions to be designed which do not exclude people who are worse-off, and for plurality in views of personal assets and the good life to be protected (chapters three and seven). In chapters four and five it is argued that the boundary between treatment and enhancement does not always coincide with what is acceptable and unacceptable, however, it is a good starting point for what the obligations of the state should be towards patients with genetic disease. The authors found no “reason to object in general to using genetic information in medical decision-making” (page 202), however concerns about both fairness in the distribution of this technology and medical risk should still be recognised. Chapter six explores in more detail the idea of reproductive freedom in preventing or allowing harm to children, and discusses ways around the “non-identity” problem to illustrate a basis for obligations to prevent harm. Another effect of this obligation, however, is that parents should strive to benefit their children with the limits of a requirement for these benefits are addressed in chapter seven, through an analysis of several disability-rights critiques of genetics.

This is an excellent book that immediately engages the reader and uses key themes of the analysis is the use of real-world examples, a recognition that there may be more than one ethico-legal perspective by Rabinow. This book is a useful and an articulation of the limits of ethical theory. Although each author has contributed to different chapters, the book does not suffer from an inconsistency of style. It is worthwhile to while it read from beginning to end, as subtle connections between many apparently unrelated issues begin to emerge. It will, however, also be useful as a tool for anyone interested in obtaining clear analysis of topical issues in genetics. An extremely comprehensive table of contents also makes the book easy to navigate.

Overall, this book provides much insight on many important questions in genetics, but it also elegantly illustrates the inherent complexity in issues that have arisen and will continue to arise when genetics, reproductive technology and parenting practices coincide.

A J Newson

Living and Working with the New Medical Technologies: Intersections of Inquiry

Edited by M Lock, A Young, A Cambrioso.
Cambridge University Press, 2000, £15.95/US$24.95, £42.50/US$59.95, pp 295.
ISBN 0521652103

This collection of essays is the outcome of a conference addressing the problems arising from the conjunction of medicine and the humanities with the ever more pressing concerns of bioethics. Since this is a fairly recent development the introduction summarises the argument about what constitutes science and whether it is culturally located. Throughout this well-produced book there is room for discussion and dispute as is inevitable in interdisciplinary work.

The first part of the book lays the theoretical foundations. Rheinberger discusses the enormous change in the ability to control the biological make up of mankind that molecular medicine is bringing. He asks whether this will effectively end the nature/culture juxtaposition. These deliberations are then placed into a philosophical perspective by Rabinow. Part two moves into real world of laboratories and clinics. Lowy discusses the important role that the concept of controlled randomised clinical trials plays in introducing scientific rigor into medicine (in fact this preceded molecular biology by many years), leading ultimately to the development of centralised, multicentre trials of cancer drugs involving close collaboration between research labs, industry and clinics, this in turn leading to quasi routinisation of dealing with incurable diseases. A comparable case is the search for anti-HIV drugs by desperate patients, which has become an interplay between pharmaceutical firms and governmental agencies dependent on the cooperation of patients willing to take part in the trials. Thus political begins to move the debate out of the purely scientific arena; and AIDS activists have gained a definite, though limited, influence which highlights the social science component of modern medicine. Clinical interviews in relation to pathological investigations show that patients have a part to play in making both clinical and surgical decisions, which in turn leads to wider social considerations of cost and efficacy. Throughout it is emphasised that disease making in diagnosis and subsequent treatment depends on various kinds of authority, literature, people’s own experience, and the illness as it is socially constructed by each patient.

In part 3 Kaufert examines breast and cervical screening as techniques and airs the debate on whether such screening is cost-effective and at what price to individuals at risk from false positives. Looking at Down’s
syndrome children, Rapo highlights the disjunction between technological advance in genetics and biotechnology and the human response of families who care for such children. A further chapter deals with “bio-moral” or “biosocial” conditions, notably MCS (multiple chemical sensitivity) and finds that in the light of conflicting interests and under-funded research any explanation of these sociomedical disorders is likely to be both tacit and locally determined. The last two essays deal with organ transplantation and unpack the problem of the dichotomy of the “gift of life” that organ donation from brain dead persons presents, versus any sentiment concerned with keeping dying patients intact—a dilemma that is much felt even within the medical profession. Approaches differ between the US and Japan. The ethical dilemma is compatible but at present there are various solutions. Ethics are generally more implicit than overt but it is agreed that they are diffusely socially determined. The final essay, which considers the ethics involved in transplant procuring whether by gift selling or cadaver donation, finds that regulations aimed at safeguarding certain rights may themselves infringe customary perceptions of what is moral. Some of the problems would benefit from an anthropological approach that takes account of the specificity of small local communities.

There are no final answers in this book, but the at times diverse essays bring together highly topical discussions about the rights and wrongs of a world that is just opening up.

Animals in Research: For and Against

The use of animals for the purpose of scientific research is an emotive subject. The moral arguments often exhibit polarised positions: the scientific demand for absolute freedom of research, and the abolitionist demand for a total ban on all animal experiments. At one extreme are those who argue that research on animals is essential, as it is a material and essential part of the battle against disease, and on the other extreme is argued that the cost in terms of animal suffering is too high and that if experiments were prohibited, medical researchers would find some other means of ensuring scientific progress.

The rhetoric employed is also suggestive of a polarity: experimenters are accused of cruelty and indifference, whereas campaigners on behalf of animals are accused of irresponsibility and insensitivity towards the wellbeing of humans. Yet to ask which side is right is to betray a misunderstanding of the complex nature of the debate, in which a plethora of intertwining political and ethical issues find expression in a wide spectrum of viewpoints.

One of the strengths of Animals in Research is that Grayson recognises the complexity of this issue, and in the opening chapter, which surveys the current political landscape of the animal research debate, there is an appeal for constructive listening. Avoiding either extreme, Grayson opens with a comprehensive survey of the many different viewpoints that have been expressed in the animal research debate. The second and third chapters focus on public perspectives on animal research and the development of legislation and regulations since the Victorian period. The fourth chapter investigates issues that have drawn the attention of scientists and animal rights and welfare groups since the 1860 act which dealt with research on animals.

As in most ethical debates neither side offers support for needless suffering, and the way forward lies in the consideration of ways in which any necessary suffering both in research and in general and individually. Chapters five and six therefore address the three Rs (replacement, reduction, and refinement) which have emerged. Each otherwise disparate party can agree. Replacement and reduction seek to minimise the number of animals used in research and refinement is bound up with the minimisation of pain, distress and discomfort on animals. This discussion is the most significant part of the book, as it indicates the possibility of dialogue and consensus among medical scientists, animal welfare campaigners, government bodies, teachers, and regulatory agencies. Grayson recognises that medical scientists are ethical and shows how the research community have demonstrated that scientists are taking legitimate concerns about animal welfare seriously. She refers to the British Association for the Advancement of Science which maintains that continued research involving animals is essential for the conquest of new medical problems, but recognises that those involved must respect animal life, using animals only when essential, and should adopt alternative methods when available. Grayson also refers to a survey of British doctors in 1993, which indicated that 94% agreement that animal research was important to medical advance, while 92% favoured involvement in the investment of non-animal research.

The final two chapters look to the future. Grayson argues that the debate on animal research is likely to intensify, with concern over transgenic animals and the use of animals as organ transplant sources. For those who are interested in the ongoing debate over animal research the final chapter provides comprehensive details of relevant organisations and web sites.

This is an excellent introduction to the animal experiment debate. Each chapter is carefully balanced and is free from the emotive rhetoric which so often clouds the arguments. Moreover, there are summaries, lists of publications, and details about interest groups which are relevant to each standpoint covered in the book. Animals in Research is an essential source for teachers and researchers in the veterinary sciences, and it will be of considerable value to the ethicist who is concerned with the broader moral issues related to medical research and animal wellbeing.

The Foundations of Christian Bioethics

In this book, H Tristram Engelhardt Jr outlines his interpretation of Christian bioethics. His branch of Christianity, termed “traditional Christianity”, is described as “the Christianity of the first millennium”. Authority is derived from the church fathers of the early Christian church and from the church community, in accordance with “the spirit” (this is contrasted with Western Christianity’s use of scriptures and philosophical theology).

In the first half of the book (chapters 1–4) Engelhardt describes the contemporary moral condition, characterised by moral diversity and fragmentedness. He begrudging the eroding effect of pluralism on moral values and the lack of mechanisms to distinguish between opposing value systems. He terms the present state of affairs as “liberal cosmopolitanism” and argues that it is a philosophy that is not available to the “principle of permission”—that is, moral authority legitimised by the autonomous choices of those who collaborate; it is procured rather than objective. In the course of these chapters Engelhardt proceeds comprehensively and persuasively to argue that “liberal cosmopolitanism” is not morally neutral but is a powerful moral framework itself—upholding the values of individual autonomy, and tolerance—and requiring adherence and belief.

Engelhardt’s thesis is that “liberal cosmopolitan” ethics, and by extension bioethics, is fundamentally flawed, because the search for universality has sacrificed moral authority and hence moral content. On these grounds he dismisses both secular and “post-traditional” Christian ethics and bioethics. “Traditional Christianity”, in contrast to “liberal cosmopolitanism”, endorses authority (mediated through noetic experience, ie experiential knowing of God) and exclusivity (terms such as “universalism” are anathema politically; intended to malign those who are not of the “liberal cosmopolitan” majority). Consequently, “traditional Christianity” is in conflict with liberal cosmopolitanism which endorses patriarchal and sexist views which are offensive to the liberal majority, and as a result traditional Christians find themselves in a hostile environment.

The second half of the book (chapters 5–8) focuses upon the practical implications of adopting this version of bioethics. There are few surprises here, as the practices which are endorsed and forbidden are similar to other conservative Christian traditions. For example, contraception is forbidden, as is abortion and prenatal testing (there is no ensoulment in “traditional Christianity”, therefore, disposal of zygotes and embryos is “murder”, as abortion is in general). In addition, little assisted reproduction is allowed: artificial insemination by husband is permissible if the wish for a child does not interfere with the couple’s spiritual quest and if there is no third-party involvement (sperm must be collected during intercourse or stimulation by the wife and the husband must carry out the insemination procedure). Of particular interest for bioethicists in this section are the differences which Engelhardt highlights between “traditional Christianity” and more familiar Christian approaches. For example, he rejects frequently cited Roman Catholic doctrines, such as the “doctrine of double effect” and arguments which appeal to biological “naturalness”.

This book contains many interesting insights, although perhaps more so for theologians and philosophers than for bioethicists, but would be unlikely to satisfy a reader looking for engagement with the practical dilemmas of bioethics. However, since Engelhardt’s intention is to return us to a first millennium version of bioethics, this is not entirely surprising. His focus on the first millennium leads him to leave out some subsequent advances which have a bearing on his argument; for example, the current philosophical understanding of the concept of human freedom is not mentioned. This said, the book has much to recommend it, such as an insightful analysis of difficulties which attach to moral pluralism and revealing comments about the philosophies of Hegel, Kant and
Kierkegaard, as well as an introduction to the ethics of Orthodox Christianity. On balance, however, this book will perhaps seem somewhat irrelevant to contemporary bioethicists, although it may prove of more interest to theologians, especially those of the more conservative persuasion, such as the emerging school of radical orthodoxy. Ultimately, the difficulty with Engelhardt’s position is communication. His rejection of “liberal cosmopolitanism” leads to an unwillingness to compromise, which makes it difficult for those from the “liberal cosmopolitan” world-view to hear his points; this is somewhat problematic given that his intended audience is the academic community.

NOTICE

A Cross-cultural Dialogue on Ethical Challenges in Healthcare

An international conference on healthcare ethics, A Cross-cultural Dialogue on Ethical Challenges in Healthcare, is to be held in Abu Dhabi, the capital of the United Arab Emirates, from 10–13 March 2002. It is being organised by the UAE Ministry of Health. Co-sponsors of the conference include the World Health Organization (WHO), the Islamic Organization for Medical Sciences (IOMS), the International Association of Bioethics (IAB), the Emirates Medical Association (EMA), and the Gulf Center for Excellence in Ethics (GCCE).

As the first such conference in the Arab and Muslim world, it aims to bring together scholars and experts from around the world to address a wide range of ethical and social considerations in the planning and delivery of health care.

The objectives of the conference are to: promote a cross-cultural dialogue towards agreement on universal standards of healthcare ethics; highlight the Islamic world’s contribution to this process; enhance awareness and knowledge of contemporary ethical issues in healthcare, and to build national and regional capacity to address complex bioethics issues against the backdrop of rapid advancements in the health sciences.

The conference will examine a broad range of contemporary healthcare ethics topics including: current controversies in research involving human subjects in developing countries; ethical decisions and considerations in clinical practice; social issues in genomics; strategies for allocating scarce resources; access issues in health systems, and building a bioethics capacity and infrastructure in the UAE, Gulf region, and Arab world.

For copies of the conference programme and registration forms please contact: Dr Basil A Badir, Conference Coordinator, Ministry of Health, PO Box 26094, Abu Dhabi, United Arab Emirates. Telephone: +971(2) 6330186 and +971(50) 6325110; fax: +971(2) 6321878 and +971(2) 6349223; email: moh_basilb@hotmail.com and ethics_conf@moh.gov.ae
