The influence of the pharmaceutical industry on the off-label use of its medicines

Last year I described in this journal an unacceptable influence of a pharmaceutical company on the off-label use of one of its products. Now I would like to report on an acceptable and even praiseworthy initiative of a pharmaceutical manufacturer in monitoring the use of its drug. The devastating action of thalidomide on the human embryo caused its withdrawal from the market in the early 1960s. This teratogenic drug began, however, to be used again when it was found that it had a favourable effect on patients suffering from various diseases.1 One of the companies producing this drug was aware that it had a moral responsibility to prevent (accidental) abuse of its product. The scientists of this company have developed a number of criteria: STEPS, that is, a System for Thalidomide Education and Prescribing which includes a registry of all treated patients (under a code number). The authors show that they are aware of possible mishaps when they write: “Despite all the checks and balances in the STEPS programme, the system will only work if it makes intuitive sense to its participants and they adhere to program requirements.” An even more stringent attitude is taken by Bouvaros and Mueller when they write: “Given the ethical complexities of thalidomide use, we recommend that individuals planning to prescribe thalidomide consult with their hospital’s institutional review board and develop their own formal protocols, independent of the consent provided by the manufacturing company. Such a consent should include information about the efficacy in the condition being studied and review adverse effects of sedation, constipation, erythroderma, neuropathy, and teratogenicity.” Strangely enough none of the authors appear to have reserved a task for the governmental safety evaluation agencies. In my opinion they should be kept informed of all clinical trials with off-label administered drugs. These administrative authorities should be allowed to intervene, if necessary at all stages of the treatment.

Comment on: the influence of the pharmaceutical industry on the off-label use of its medicines

Gebhardt draws attention to an important issue. The responsibility for informing and warning patients about adverse effects and how to prevent them, or to recognise them early and minimise harm, is shared between the manufacturer, the national regulatory agency, the prescriber, and the pharmacist. The first two must ensure that prescribers and pharmacists are adequately equipped and helped to do their part. Any printed information needs to be tested on a sample of actual patients to demonstrate that over 90% can actually understand and use it. Beyond that, doctors and pharmacist must be motivated and helped to check (and document in their records) how well the individual patient has understood the problems and the information.

BOOK REVIEWS

Voluntary Euthanasia and the Common Law

At first sight, this might not seem like the sort of book in which an ethicist would be interested. Such fears are compounded when one reads in the introduction that the book is “primarily a legal analysis” of the issues (page 4). It is liberally sprinkled with footnotes, mainly legal in nature and surely we do not need another book about euthanasia? But we do, and this book is not only one ethicists can read, it is also one they should read. Otolowski argues that any examination of this subject matter necessarily involves “consideration of wider issues, including social change, as reflected in opinion polls and community agitation for reform, the practice and attitudes of the medical profession, as well as consideration of religious, moral, and ethical arguments” (page 4); and this is what the book provides. Thus, it is much more than a legal analysis, though everything in the book flows from this.

The main thesis presented is that the law does not in practice reflect or enforce the reality of doctor-patient contacts at the end of life. Rather, there exist “discrepancies” (page 128) between the theory and the practice of law, and an inherent “hypocrisy” (page 150) in what the law actually does when confronted with these cases. Otolowski argues that in practice criminalising voluntary euthanasia is counterproductive. She highlights two possible effects: first, medical decisions may not in practice be susceptible to evaluation by the courts, leading to a lack of regulation; and, second “there is a real risk of abuse if the law condones what is an unregulated practice” (page 151).

The process through which these effects come about is simple, Otolowski claims. She shows how in selected countries, whilst voluntary euthanasia is illegal (this is the theory), there is evidence of an empirical nature that doctors are, in fact, helping their patients to die. Furthermore, the law, via such “legal fictions” and “unworkable distinctions” as those between “acts/omissions” and “killing/letting die”, is in conflict with the deception. What is left, she argues, is a regulatory vacuum.

Otolowski argues that there appears to be little interest in the law’s strict enforcement, the “most significant point to emerge from the . . . analysis is the scarcity of cases involving the prosecution of doctors . . . . This contrasts markedly with the available information regarding doctors’ practices” (page 147). This is of course not only a matter for the law, for if, as Otolowski claims, voluntary euthanasia is practised this raises important ethical questions.

The book continues by considering not only options for reform, but also the desire for it. We are treated to the results of opinion polls in various countries throughout the world, a “case study” of the Dutch experience, and more insight into the distinction between the theoretical and the real. It is here that the book is at its best, and of most help to ethicists; for what Otolowski attempts is to tear the . . . analysis is the scarcity of cases involv-
eliotics is this: do not be bogged down in dogma; for that is how we arrived at the situation we are in now. Rather, our ethical response should be shaped by the reality of what works, so crossing the Rubicon from the hypothetical to the practical.

**Primer for Health Care Ethics: Essays for a Pluralistic Society, 2nd edn.**

This is a thoroughly revised and expanded edition of a book originally published in 1994. It consists of a series of clear and thoughtful short essays, grounded in real cases in health care ethics. The range of coverage is extensive, touching on such matters as the legal right to an abortion in virtually all circumstances, even rape, is affirmed, as is the conviction that an embryo from the moment of conception has the status of a human being rather than a potential human being. There are numerous impressive examples of the vigour and cogency of discussions within that tradition of the ethical acceptability of specific forms of treatment.

The book directly addresses the injustices generated by the fact that in the United States some four million people do not have proper medical cover, and by the invasion of health care by the market: “the only way to solve the health care problems in our society is to insist continually that we must have universal health care coverage. Until that goal is accomplished, we are fighting bush fires and ignoring the underlying problem of ethical pluralism, but its tone is constructive and positive rather than hectoring, arrogant, or aggressive. Secondly, the book presents itself as a ‘primer’, but denies that it is intended to be a textbook. Probably its real value is as a resource and a stimulus for conscientious and reflective practitioners, and for students of ethics who are anxious to ground their studies in real situations.

**Death and Compassion: A Virtue-Based Approach to Euthanasia**

Can virtue ethics tell us what to do? And has principilism had its day? These are two of the major questions that Van Zyl seeks to answer in the affirmative. Van Zyl wishes to encourage an approach to medical practice that draws upon the requirements of virtue ethics, in preference to principilist (primarily deontological and consequential) ethics. Her account then relates these twin themes to one concrete realm of medical practice, decisions taken at the end of life.

Van Zyl believes that the process of modernisation has infected medicine, in its evolution from an “art” into a “science”, but also medical or bio-ethics, in its move to a principilist ethic, which demands the application of universal, rational, objective rules to “cases”. Such an ethic leads in some dissatisfaction with the medical focus, since it is just that, while the patient’s wider “suffering” passes unnoticed. Virtue ethics—which is the approach that Van Zyl advocates—seeks to address such suffering, and it has been relegated to—best—a “place on the sideline”. In contrast to such popular, but bare and impersonal, principles as beneficence, non-maleficence, and autonomy, Van Zyl lays emphasis on Aristotlean ideas to reintroduce these three related virtues: compassion, benevolence, and respectfulness.

The virtue of compassion encourages an empathetic identification, and hence engagement, with the patient and his or her suffering. Benveolence encourages truly beneficent, helpful actions, which will result from this fuller understanding of the patient’s predicament. Finally, respectfulness encourages full respect for the patient as a self-realising individual. A dialogue conducted in accordance with this virtue will result in shared decision making, as opposed to the doctor or patient-directed approaches pursued by, respectively, paternalistic and autonomy-based models.

In line with the expanded (patient-directed) tasks of medicine, and hence engagement, with the patient and his or her suffering, Van Zyl contends that where this goal cannot be achieved, and where continuing care might be harmful, euthanasia might be permissible, in either an active or a passive sense. Euthanasia, as a last resort, can therefore be justifiable as a compassionate, benevolent, and respectful response to a patient’s suffering. Although Van Zyl draws some tentative conclusions as to situations of justifiable euthanasia, she also accepts that there will be numerous cases that are not so amenable to resolution in these the process of interaction between physicians, patients and patients’ families might be more important than the actual decision reached.

To get the inevitable pun out of the way, this book cementally has its virtues. Principally, the book succeeds in offering a useful counter-balance to the plethora of texts devoted to the ethical accounts of morality, and the morality of euthanasia in particular. Moreover, Van Zyl’s account might cheer those who despair at the limitations of the contemporary focus on, and, particularly, autonomy. On a more mundane note, the argument is also well sustained and accessibly presented.

Perhaps inevitably, however, a few vices warrant note. Principally, Van Zyl’s argument might not in fact constitute an alternative because, in suggesting, for example, in the closing chapter, that virtue ethics can nevertheless find some “rules”, Van Zyl arguably strays onto the principilist ground she is so keen to avoid. More generally, although Van Zyl’s criticisms are often well aimed, the principilist objection might stand, since it is not clear that virtue ethics alone will determine the morality of conduct. For example, would it fit with current professional and legal obligations? Similarly, how are both practising and future doctors to be educated in the virtues? The sorts of institutional responses that are needed would almost certainly need to have some principilist component. It is perfectly plausible that virtue ethicists can and will answer such questions. It is a shame, however, given her useful reconsideration of a much discussed concrete topic, that the author uses most of her text to set out her stall, when the practical applications of virtue ethics—as she concludes—need greater ones.

These points need not be laboured, however, since Van Zyl’s text is a vital corrective to much contemporary theorising. The book is therefore recommended, particularly to researchers and students, although practising doctors might welcome this often refreshing perspective.

**Extending the Boundaries of Care: Medical Ethics and Caring Practices**

The title of this book embraces a subject that is very topical in the field of health care. It is a collection of papers most of which were initially presented at the Centre for Cross-Cultural Research on Women. All but one of the authors are women. The papers themselves are very disparate, covering diverse topics in a variety of ways. Subjects covered include a daughter’s story of her mother’s dying and death from undiagnosed Creutzfeldt-Jakob Disease; the problems for parents raising triplets; issues arising from the Depo-Provera contraceptive debate; the nature of human rights in relation to medical care; disease prevention; methods of research in relation to HIV and men who have sex with men, and nurses’ moral/political voices as expressions of care. Each writer’s subject of focus demonstrates their own personal interest, even passion, within health or social care—hence their own deep concern or “care”. As a consequence it is difficult to find a unifying thread in the book, which is perhaps why the particular title was chosen.

To get the inevitable pun out of the way, this book certainly has its virtues. Principally, the book succeeds in offering a useful counter-balance to the plethora of texts devoted to the ethical accounts of morality, and the morality of euthanasia in particular. Moreover, Van Zyl’s account might cheer those who despair at the limitations of the contemporary focus on, and, particularly, autonomy. On a more mundane note, the argument is also well sustained and accessibly presented.

Perhaps inevitably, however, a few vices warrant note. In their introduction, the editors attempt to frame and explore what they consider the book’s common theme, “the way ‘care’ is conceptualised and practised”. They are keen to stress that the focus is not abstract ethical issues related to care but the real ways in which individuals and groups grapple with situations involving care. This is no constructed consensus, rather authors struggle in a discussion that extends and refines the caring boundaries. In their view healthcare and care models are socially constructed. Models of care, definitions of care, technology and its effect on care, gender roles in care, and the nature of care itself for the receiver, are amongst issues that arise, and are discussed and explored in the chapters. As the editors acknowledge, however, it is very difficult to define this abstract concept, “care”, and this difficulty is exemplified in the book.

Informed Consent in Medical Research

Debates over research ethics have until recently revolved around two related questions: the voluntary, informed consent of subjects; and, the appropriate relationship between risk and benefit to subjects in the experiment. Recently more attention has been paid to the voluntary, informed consent of researchers in the international arena, and to issues of the scientific and financial probity of researchers.

Clinically the difficulties of obtaining the informed consent of subjects in research remain one of the more difficult barriers to research. Recently this issue has become more fraught in non-clinical research also, with complex debates over consent to the use and reuse of clinical information or stored tissue samples in epidemiological and genetic research. The trade-off between public interest in the development of epidemiological research and the rights of individuals to decline participation in such research remains precarious. The possibility that a surgeon might need to explain not only randomisation and equipoise between surgical procedures, but also the possible commercial exploitation of tissue samples extracted from surgical waste gives most thoughtful people pause at the difficulty of this process and the complex way in which scientific, therapeutic, and commercial elements are intertwined in it.

Confidentiality and Mental Health
Edited by C Cordess. Jessica Kingsley Publications, 2001, £15.95 (pb), £47.50 (hb), pp 201. ISBN 1853028592

The respect for confidentiality and the rhetoric of openness form the argument in mental health. But in addition mental health has always had its inherent problems: over ethical practice since it has, to this day, inevitably retained some element of medical paternalism. This places practitioners in a position in which they have a responsibility for the care of their patient, but also a responsibility for the protection of society. The potential conflict of interests in mental health often have deep moral implications, that do not exist in general medicine.

Chris Cordess has produced a timely book in which he has written, with colleagues, about the need for a general guidebook to the range of practical ethical problems in consent in research. This book reproduces the controversy from the BMJ in full, which in itself
makes for a useful documentary casebook. What makes this book worthy of wide consideration is the wealth of additional material. Part 1 of the book reproduces the Nuremberg Code and the 1996 version of the Declaration of Helsinki, together with classic material by Henry Beecher and Maurice Pappworth on "human guinea pigs" and some valuable historical articles setting this material in context. Part 2 reproduces the articles and correspondence from the BMJ. Part 3 contains reviews of the "state of the art" on informed consent in research in a variety of contexts, including research with children, genetics research and access to patients' records for research purposes. Part 4 reviews the moral role of informed consent and how better to achieve both consent and respect for its importance, in particular through education, consumer involvement and communications skills. The book concludes with closing remarks by the editors.

The reader interested in the complexities of current debates on consent in research will find this a very valuable guide. The chapters are rather brief, which make philosophical depth difficult to achieve. The cumulative effect of reading 32 short articles can be exhaustion and confusion. Taken individually, however, the articles are on the whole very well written and informative. The reader has a sense—unusually in a work of this kind—of an evolving debate and a growth in sensitivity of the contending parties to each others' positions and the rationales underlying them. Some of the articles are likely to be classics in their own right, and all of them are stimulating. For this reason, the book transcends the "occasional" character of its source material, and is likely to have a long life in the reading lists and the libraries of researchers, doctors, and research ethics committees.

R Ashcroft

NOTICES

Ethics in health care

Oxford Brookes University and Oxford University have collaborated to develop a course which helps health professionals deal with difficult ethical decisions. The Ethics in Health Care course aims to give people practical skills that can be used in health care decision making. Course participants will increase their ability to analyse and assess arguments, apply ethical concepts to moral dilemmas, and articulate their own values and feelings.

It can be part of MSc programmes offered by both universities or a stand alone module and involves five days of lectures interspersed with workshops and student led seminars. It is based at the University Department for Continuing Education at Wellington Square, Oxford.

4th Asian Conference of Bioethics: call for papers

The 4th Asian Conference of Bioethics will be held from 22–25 November 2002 at Seoul National University, Seoul, Korea.

The sponsors are: the Asian Bioethics Association, The Korean Bioethics Association, The Korean Society for Medical Ethics Education, The Korean Association of Institutional Review Boards, the International Association of Bioethics, the Japan Association of Bioethics, the Chinese Society for Medical Ethics, the All India Bioethics Association, the Eubios Ethics Institute, and the Journal of Medical Ethics.

Deadline for Papers: 31 October. Format: Microsoft WORD 97 or higher. Language: English. Submissions to: ethics65@netsgo.com For further information please see: http://www.koreabioethics.org
