LETTER

If you have a burning desire to respond to a paper published in JME, why not make use of our “rapid response” option? Log onto our website (www.jmedethics.com), find the paper that interests you, and send your response via email by clicking on the “eLetters” option in the box at the top right hand corner.

Providing it isn’t libellous or obscene, it will be posted within seven days. You can retrieve it by clicking on “read eLetters” on our homepage.

The editors will decide as before whether to also publish it in a future paper issue.

Medical commitments ceremonies

I read Raanan Gillon’s piece on the defence of medical commitments ceremonies with interest. I was, however, disturbed to see that in the declaration of a new doctor considered satisfactory at Imperial College there is no mention of age among the politically correct list of human and social characteristics that should not influence a doctor’s duty of care. The omission is conspicuous in view of the abundant evidence that age discrimination is widely practised in medicine and that it has recently been proscribed in the National Service Framework for Older People. Does this mean that I must advise all my elderly patients that in any encounters with graduates of Imperial College they must insist on a second opinion?

BOOK REVIEWS

The Ethics of Genetics in Human Procreation

Edited by H Haker, D Beyleveld. Ashgate Publishing Co, 2000, £45.00 (hb), pp 335. ISBN 0 7546 1021 7

This is a challenging book that I recommend for anyone who wishes to engage with contemporary philosophical discussions relating to assisted reproduction, pre-implantation genetic diagnosis (PGD) and embryo research. It consists of six principal papers, each accompanied by responses from two discussants. There is also, in an appendix, a summary of the discussion that followed each of these six sessions in the final symposium of the EU-funded European Network for Bio-medical Ethics held in Sheffield in 1999. In addition, there is a seventh paper in which the network, funded from 1996–1999, is evaluated, and there are introductory and closing remarks to the volume by Dietmar Mieth, Professor of Social Ethics at Tübingen.

In his introductory contribution, Professor Mieth asks us to consider the words that are used to describe the practices of IVF and PGD and the problems they generate. He follows Illich in problematising the word “life”, tracing its use over the past two centuries in the context of our mechanistic biology and our society’s “passion for individualism”. He argues that the terms of the “official” moral debates in this area—the terminology of bioethics as well as the terms of reference of the learned bodies and committees—have pre-empted these deliberations so that they can only lead to the fully liberal, permissive position.

In the first major paper, Sheila McLean discusses the “right to life”. What does this amount to? When may obligations to a future child restrict or potentially infringe upon parental freedom to make specific decisions? And when can individual wishes be challenged in the interests of society—the wider community?

In the responses to this paper, Anders Nordgren sets out a coherent position in which there can be limited, local, contractarian rights to fertility treatments and a limited autonomy on the use of prenatal diagnosis and decisions about selective terminations of pregnancy. Onora O’Neill applies the concept of the “good enough” parent to the realm of assisted reproduction, and asks how the new ways of becoming parents may lead to new ways of being parents. She asks us to examine the ethical issues in this area from the perspective of children born as a consequence of these new technologies. She emphasises the differences between that perspective and that of the perspectives of children who have been adopted or fostered. An increase in choice for adults may lead children to feel rejected by their genetic or gestational parents. Chosen relationships are often understood as very different from given relationships, and more easily become conditional. How may this alter parent-child relationships? Notions of autonomy, it is argued, should not be the only or central concern in regulating this area. Finally, Walter Lesch discusses the question of when parents or children can be considered “good enough” in the genetic sense. He maintains that it is legitimate for the standard of “good enough” to vary, depending upon the biological and social origin of the child.

A similar format applies in the five other sections. Derek Beyleveld presents a technical argument about the status of the embryo and the fetus, starting from the ethical system of Alan Gewirth. I found this unconvincing, as did the two discussants for several reasons, but I am happy to concede that this topic is outside my area of expertise.

The third paper is presented by Jean-Pierre Wils. Autonomy, it is argued, only makes sense in the context of a relationship in which the other is recognised as a(nother) moral agent. Accordingly, the difficulty in achieving this in relation to an embryo or fetus makes it difficult to treat the embryo with full respect, and technological modes of visualising the embryo or fetus can make this even more difficult. Our habits of perception pre-empt our ability to choose how to understand what we see. Wils argues for a graded recognition of (active) personhood or (passive) moral rights. In the discussions, Engel emphasises the danger of determinism and Dierickx discusses the depersonalisation that often accompanies prenatal screening programmes at the population level and the altered notion of responsibility (for the genetic health of one’s children) that now nature need not simply take its course.

The fourth paper, by Regine Kollek, locates the new reproductive technologies within modernity—and therefore within the paradoxical conjunction of both increased freedom and heightened accountability for one’s “free” choices. The notion of risk management is crucial to this paradox, and Kollek discusses the impact this has on women’s lives. The ways in which the new reproductive technologies can reinforce the emphasis on genetic identity—one’s “true” family consisting of one’s molecular relations—is also discussed. And Kollek echoes Mieth’s criticism of bioethics as a mechanism that controls and silences opposition to the new reprotechnologies. The discussants to this paper both challenge Kollek and extend the scope of her argument.

The fifth paper, by Marcus Duwell, is methodological; it considers how to justify an ethical position in this area. He outlines several of the areas of contention already discussed and proposes a framework within which to consider them. He suggests—and I disagree—that bioethical principles can define what is justified, allowed or forbidden while other considerations (of apparently lesser importance, beyond the scope of ethics) can guide other aspects of behaviour. The discussants criticise this view too, objecting to the narrow scope of applicability of this ethics and the framing of ethical responsibility as (merely) the recognition of justified interests.

The final paper, by Beyleveld and Pattinson, examines the legal frameworks within which various European countries tackle IVF, PGD, cloning, and related technologies. The substantial differences are accounted for in several ways, including messy political compromise, and the nation-specific meshwork of legislation and non-legislative regulation, professional codes of practice etc—as discussed further in a commentary. The other discussants examine the specifically medical aspects of fertility treatment.

This is a wide ranging volume that examines reprotechnology and reproductogenetics from several, conflicting perspectives. The resulting compilation is especially valuable for bringing
strands of Continental philosophy, with a heavy representation—especially from Tübingen, into dialogue with a more Anglo-Saxon bioethics. This breadth of perspective is uncommon, impressive, and very helpful. I hope that further contributions of this sort emerge from future collaborative projects in Europe.

The Concise Encyclopedia of the Ethical Assessment of New Technologies

While offering extensive new opportunities, technological developments also tend to pose serious challenges and difficult ethical questions. Developments in—for example, biotechnology, reproductive technology, and nuclear technology—and nuclear technology have for decades been the subject of intense public debate and a principal object for philosophical reflection and ethical analysis. The Concise Encyclopedia of the Ethical Assessment of New Technologies is a collection of articles, thoughtfully edited by Ruth Chadwick, which addresses a range of the ethical issues pertaining to contemporary technology.

The editor’s objective in this collection appears to be to describe general methodological issues in ethical analysis and to give an account of the practical application of ethical theory to issues surrounding new technologies. Some of the articles provide an outline of conceptual frameworks for ethical analysis and key ethical principles—for example, discussions of consequential and deontological perspectives, the precautionary principle, and slippery slope arguments. Other articles go beyond these methodological issues and apply ethical terminology to specific technologies such as genetics, computers, nuclear technology, and reproductive technology.

The collected articles all have a standardised and easily accessible layout and are arranged in a single alphabetical list by topic. This confirms what is already suggested in the book’s title, namely that the encyclopedia is a scholarly reference work. The main body of each article follows a short outline section, including a preview of headings, a glossary of essential concepts, and a brief introductory paragraph defining the debated issues and summarising the content. A short bibliographical completes each article.

The encyclopedia provides a detailed first introduction to a number of new technologies and the ethical issues pertaining to them. The very helpful introductory paragraphs make it easy for the reader to focus on essential themes and the glossary makes it possible to keep abreast of developments. Sometimes complex technical and philosophical issues. Most articles are easy to read and the authors succeed in giving a nuanced account of often quite controversial issues. However, the limited space available makes it difficult for the articles to be more than good and thorough introductions. An extended bibliography, consisting of suggestions for further reading, could make the encyclopedia an even better work of reference.

Naturally a collection of articles on a very broad subject such as new technologies will have to depend on a cautious selection among a large number of relevant and important topics. It seems the articles for this collection have been selected with some preference for biotechnology and medical technology, and although the book to some extent also addresses the impact of other technologies it leaves the impression that ethical questions relating to bio/medical technologies are particularly numerous and significant. The distinct focus adopted in the selection of articles suggests that this is a work aimed mainly at an audience specifically interested in biotechnology and medical ethics.

In sum, The Concise Encyclopedia of the Ethical Assessment of New Technologies impresses as a highly applicable reference work, particularly for readers with an interest in biotechnology, medical technology, and medical ethics. The book is easy to use for reference but also serves to bring attention to important new issues and emphases the need to develop the conceptual basis for analysis as new technologies emerge. For that reason it is likely to become essential reading for ethicists, medical students, scientists, and others working with the ethical implications of technology.

Legal and Ethical Aspects of Organ Transplantation

Some lawyers, even some academic lawyers, have developed the happy knack of being in the right place at the right time, without being ambulance chasers. D Price, with not only a timely but a thoughtful and thought provoking examination of organ transplantation and associated questions of commerce and commodity in body parts, seems almost prescient. Did he know, when he set out to compose what has emerged as his elegant and authoritative account and critique, that bodies and body parts were about to become one of the most controversial intellectual properties for years?

Price’s corpus is in three parts: predictably cadaveric organ transplantation and living donors comprise the most substantial elements of his exegesis and critique. While his review largely antedates cell nucleus substitution and the potential therapeutic application of stem cell research, he recognises that this is one of a number of “alternatives” to current transplant technologies that will later require more comprehensive consideration and review. In a third, concluding section, he addresses the troubling issue of “commerce” and the troublesome one of “recipients”. Throughout, his analysis and arguments are driven by the need—as he perceives and defends it—to respond to “medical globalisation”. This entails setting in place an integrated, coherent, and global conception of appropriately liberal transplantation practice, and a similarly fashioned and dedicated form of regulation.

Price attempts to stake out what for him would be a coherent and defensible position on organ transplantation, which may be of global reach and appeal while yet remaining sensitive to culturally and politically diverse circumstances. As others have concluded, this is no mean task, and yet the attempt is an important and urgent one. Too often, in the absence of some agreed alternative framework for international approaches to modern scientific biomedicine the contemporary default mechanism of market regulation succeeds. Here, Price is shy neither of introducing nor courting controversy. He engages with commerce (it is “too dismissive to simply sideline at least consideration of commercial schemes”), marries doubt about the whole-heartedness of utilitarianism (too long dominant in public policy and mandatory in transplant policy), with an appeal to relativity (“philosophical choice in a specific cultural milieu”), but would divorces the views of potential donors from those of their relatives, and advocates a position of enhancing preference for doing as the former (would have) wished, to what the latter would have done.

Price concludes that developed countries which do not facilitate an increase in organs available for transplantation purposes encourage the development of an alternative trade in organs. Thus, exploration of supranational responses to need and regulation are necessary to protect donors, recipients and health care professionals, while yet encouraging donation and increasing the supply of transplantable organs. One of the keys to unlocking this response is a strong slice of autonomy—so that the premises of potential donors are neither frustrated nor assumed—and another is a mild draught of commercialisation. Failing this, Price would advocate a system of mandatory choice and adherence to those choices even when they would encompass presently legally dubious practices—such as elective ventilation.

This is a comprehensive and considered book with legal approaches to organ transplantation which, as far as lawyers have been concerned, has been strangely lacking as a companion to a number of excellent studies of the philosophy and ethics of the subject. But Price engages also in those ethical debates and arguments, and compared with many who have surveyed other discrete areas of modern biomedical practice has done so from a broad international perspective (one example more in this essay from the rich and vibrant traditions of South America than in many comparable volumes. This is a particularly welcome addition to the emerging library of international biomedical ethics and comparative law.

Transplantation Ethics

Transplantation Ethics is a book that will be welcomed by teachers and students of medical ethics as well as health care professionals and policy makers involved in transplantation issues. The book provides a broad overview of recent and contemporary debates relating to organ transplantation, while also defending particular methods of approaching the ethical questions and using them to argue for particular policy proposals. Most of the book’s chapters are based on previously published material, and while this has the certain amount of repetition, the overall result is coherent and highly readable.

The book is divided into three parts. The first addresses the definition of death, a matter which is clearly of great importance for
transplantation ethic given the rule that vital organs may only be removed form a corpse, but on which opinions are highly divergent. Veatch reviews the debates surrounding the shift from cardiorespiratory to brain-oriented definitions of death, but argues that the currently favoured whole-brain approach is an unstable compromise, subject to the same kinds of objection that its advocates level against the traditional cardiorespiratory accounts. The whole-brain definition should therefore be abandoned in favour of a higher-brain-oriented concept which acknowledges that a person is dead—and that "death behaviours" such as mourning and dying are appropriate—even if he or she has permanently lost the capacity for consciousness. Recognising, however, that this is not an issue where consensus can be expected, Veatch proposes a "conscience clause", according to which individuals would have the right to choose, from a range of alternatives including traditional, whole-brain, and higher-brain accounts, which definition to apply in their own case. This is an interesting idea, though one wonders whether it would not better be formulated as a right to select the conditions under which lifesaving treatment may be ceased and organ procurement initiated, independently of the determination of death.

The second part of the book deals with organ procurement. Here Veatch focuses on the "outrageously unethical" attempt "to hold out the provision for opting out" with provision for opting out of the consent and donation model by using a "presumed consent" as an alterna- tives including traditional, whole-brain, and higher-brain accounts, which definition to apply in their own case. This is an interesting idea, though one wonders whether it would not better be formulated as a right to select the conditions under which lifesaving treatment may be ceased and organ procurement initiated, independently of the determination of death.

The second part of the book deals with organ procurement. Here Veatch focuses on the "outrageously unethical" attempt "to hold out the provision for opting out" with provision for opting out of the consent and donation model by using a "presumed consent" as an alternative to the consent and donation model. However, Veatch allows that the right to choose, from a range of alternatives including traditional, whole-brain, and higher-brain accounts, should not be formulated as a right to select the conditions under which lifesaving treatment may be ceased and organ procurement initiated, independently of the determination of death.

This is a compact, nicely written book that provides a rejuvenating alternative to the utilitarian orthodoxy that dominates contemporary bioethics. There is currently a dearth of bioethical literature presenting what might be called a more traditional approach to medical, ethical, and policy issues concerned with the allocation of health care resources in general, and not just those with a particular interest in transplantation.

Overall, Transplantation Ethics is a valuable contribution to the field. It is accessible to non-specialists while providing a thorough treatment of the issues and a high standard of argument. Although the book has a strong US orientation in its discussion of law and policy issues, this does not detract from its interest or relevance to readers elsewhere.

**J Hughes**

a.hughes@kcl.ac.uk

**Life and Death in Healthcare Ethics: A Short Introduction**

This is a compact, nicely written book that provides a rejuvenating alternative to the utilitarian orthodoxy that dominates contemporary bioethics. There is currently a dearth of bioethical literature presenting what might be called a more traditional approach to medical, ethical, and policy issues concerned with the allocation of health care resources in general, and not just those with a particular interest in transplantation.

This contribution is a short and useful introduction to such an approach. The book announces itself as being written "both for the general reader and students in medicine, nursing, law, philosophy and related areas in mind". Accordingly, it assumes no prior knowledge of ethics. It gives a neat introductory overview of some ethical concerns raised by reproduction, death, and dying. The issues considered include euthanasia and withdrawal of treatment, the persistent vegetative state, abortion, cloning, and the right to refuse medical treatment.

By beginning the early chapters with a real-life case, Watt captures the interest of the reader. This is followed by brief explorations of the controversial topics of abortion and embryo destruction. The final chapter looks at the question of moral disagreement and conscience objection. It is a reminder, if any be needed, of the practical nature of moral theory. It is the book's simplicity that leads me to believe that it will be read eagerly by students from a range of different disciplines. The layout and typographical style make the book particularly accessible. There is a comprehensive index and bibliography. If I have a criticism, it is that the book could have been longer. However, for
those who want a basic text to introduce them to life and death issues in bioethics, this is a most welcome contribution.

J Loing

The Medical Profession and Human Rights: Handbook for a Changing Agenda

Doctors are to good governance what the miner’s canary is to desert air: their testimony is the signal that something has gone seriously wrong. For someone like Wendy Orr, who was a South African district surgeon of 24 when she was forced to confront the lax attitude towards abuse of prisoners’ rights in her workplace—the building in which Steve Biko had been tortured—the decision to fight a prevailing medical culture of complicity and passivity was a clear and obvious ethical decision. Through this well-structured, comprehensive, and clearly written handbook begins with Wendy Orr's story in her own words, its theme is that the air is more polluted, and that human rights abuses are more of a problem for practitioners, than we like to think.

The effect of human rights abuses on doctors has broadened in the thirty years since the BMA first began to monitor such issues. Conversely, and more hopefully, the effect of the medical profession on human rights abuses has also deepened. Doctors and their constituent organisations around the globe are more aware of the myriad ways in which the medical profession may be called on to be complicit in rights abuses, and less likely to do so. For example, the Indian Forum for Medical Ethics condemned the supposedly more humane practice of asking a doctor to certify death rather than prolonging hanging, since if the victim was still alive, the doctor was in fact being required to say “Not dead yet, carry on killing”. More generally, the prison physician may feel that his or her participation in capital or corporal punishment work is less abhorrent or morally impermissible than the punishment itself.

Against this argument, the BMA notes dryly that “Medical participation usually brings… an air of propriety” (page 168).

One final note, if I may: the Centre for the Study of Global Ethics is currently presenting a series of six public lectures drawn from some of the topics in this handbook—the death penalty; embryonic and stem cell research; organ transplantation and human rights. If you are interested in the day to day nitty-gritty of consent and confidentiality.

D Dickenson
d.dickenson@bham.ac.uk

Although I am glad to see women's rights taken seriously as human rights in this book, I have some doubts about the wisdom of concentrating women’s issues largely in one chapter, comprehensive though it is (with material on violence against women, enforced sterilisation and abortion, “honour” killings and rape in wartime, and female genital mutilation). There are other ways in which women are exploited by or with the complicity of doctors—particularly in commodification of gamete donation, which will be especially worrisome in light of the need for enucleated eggs in the stem cell technologies. It was disappointing not to see much mention of the disproportionate structural and administrative injustices and power dynamics and the need for the chapter on health as a human rights objective.

The Medical Profession and Human Rights is nevertheless a very important book: testimony to the need for the British Medical Association to continue using its unique position at the hub of Commonwealth and other international medical professional bodies, in order to bring to public and professional attention wider ethical issues than the everyday nitty-gritty of consent and confidentiality.

This is a book for dipping, rather than reading at one sitting, not least because few of us can stand the sustained grimness of much of what has to be reported. Busy practitioners might want to begin at the end, with the succinct, clear-headed and hard-hitting summary of all the book’s recommendations, and work back from there to the individual topical chapters in which the recommendations first appear. I hope that teachers of medical ethics—and more broadly, anyone who has a role in training health care practitioners at any level—will find the book a valuable resource. I will make time for the chapter on teaching ethics and human rights, which, like the rest of the book, is admirably wide ranging, considered, and comprehensive.

One final note, if I may: the Centre for the Study of Global Ethics is currently presenting a series of six public lectures drawn from some of the topics in this handbook—the death penalty; embryonic and stem cell research; organ transplantation and human rights. If you are interested in the day to day nitty-gritty of consent and confidentiality.

D Dickenson
d.dickenson@bham.ac.uk

Principles of Biomedical Ethics, 5th edn.

The Principles of Biomedical Ethics by Beauchamp and Childress is a classic in the field of medical ethics. The first edition was published in 1979 and “unleashed” the four principles of respect for autonomy, non-maleficence, beneficence, and justice on the newly emerging field. These are the first four principles. The next two levels of principles mediate between high-level moral theory and low-level common morality, and they immediately became very popular in writings about medical ethics. Over the years Beauchamp and Childress have developed this approach and vigorously defended it against the various criticisms that have been raised.

The 5th edition of this book is, as all the previous editions, well written and for the most part very persuasively argued. In some places the authors’ intention of being comprehensive does, however, create problems. There are, for instance, places where opposing views are mentioned merely in order to be summarily dismissed as “morally perilous” without further argument.

What is new in the 5th edition? The main theoretical novelty is that the authors now clearly state what they mean by “common morality” and that this definition has changed somewhat from previous editions. Where morality was viewed as a set of socially sanctioned norms, the common morality is now defined as “the set of norms that all morally serious persons share” (page 3) and it is linked explicitly to human rights discourse. This is a major new theoretical commitment on the part of Beauchamp and Childress and saddles them with the problem of showing that there really are any norms that “all morally serious persons share”. In terms of the idea that there are norms that are to some degree congruent with “common morality”, thereby introducing a problematic circularity in their analysis of common morality.

The structure of the book has also been changed. The chapters on moral theory and moral justification are now the last chapters and have swapped places with the chapters on moral norms and moral character. This is presumably to make the book more accessible to health care professionals.

The whole book has been comprehensively rewritten, but the core arguments in the four chapters explicating the four principles are still the same. This also means that the restrictive limits in the scope of the principles of beneficence and justice are still open to the same criticisms that were levelled against the previous editions of the book.

For the person who already has the 4th edition on the bookshelf, and who is not actively using the book for teaching or study there is thus little reason to buy the 5th edition although it is very modestly priced. The underlying arguments have changed to some extent, but the conclusions are pretty much the same.

S Holm
soren.holm@man.ac.uk

Word ethics. Dilemmas for Medical Students and Doctors in Training

Kushner and Thomasma have assembled a distinguished group of contributors who are almost all practising clinicians with an interest in ethical issues. The book is well laid out and is divided into two main parts: part one “On caring for patients” and part two “On becoming a team player: searching for esprit de corps and conflicts of socialization”. This is a convenient way to think about medical ethics.
Part one covers the ethical dilemmas of doctors caring for patients and the many practical problems that arise; this area of medical ethics is what most doctors would consider to be “true” medical ethics. Many doctors would not consider part two to be medical ethics at all, because once a person has fully undergone the process of becoming a medical professional they can lose sight of the ethics involved in professional interactions. This is not to say this area of medical ethics is not important, indeed, it is extremely important but is not often considered by doctors in their everyday practice. The medical student, however, is in a better position to evaluate the ethical problems arising in training and staff interaction because they have not yet fully undergone medical socialisation.

Each of the two main parts is further subdivided into sections. The first section of part one is performing procedures. This covers informed consent; the person performing the procedures when inexperienced; blaming the patient for your own shortcomings; doctor-patient confidentiality; the newly dead and their rights, and peer and senior support in conflict situations. The format within each subsection is identical throughout the book. One to five clinical cases are briefly described that will be instantly identifiable to any medical student or doctor. Two commentaries then follow, written by different contributors. These commentaries are in general well thought out, logically argued, and pitched so that someone with little or no prior exposure to medical ethics will be able to follow, written by different contributors. They describe “moral dissonance” as the conflict between descriptive and normative ethics and that the former is unfairly devalued. Together they provide an invaluable tool for everyone, Paul Atkinson’s work with training doctors, and Priscilla Alderson’s ethnographic studies of children and their parents in hospitals, are especially valuable as they bring home the reality of the medical environment of the time.

The second section of the book covers all aspects of professional behaviour, including: abuse (psychological, physical, and sexual); professional communication (jargon and humour); questioning authority and the status quo; alcohol and drug abuse; mistreating patients; covering up, and misrepresenting research. These issues are rarely covered in medical education and it is to be hoped that through this book their profile will be raised in mainstream medical education. The second section is as equally well written as the first and the authors communicate their views clearly.

I think this book would make an excellent basis for a course in medical ethics for medical students. The course could be taught as a continuous module or a number of planned sessions throughout an academic year. Ward Ethics is also very suitable for trainee doctors, if not all doctors, and I would recommend it to anyone with the slightest interest in medical ethics.

R. N. J. Graham
ngraham@doctors.org.uk

Bioethics in social context

Hoffmaster endeavours to enrich the dominant bioethical paradigm, based on abstract principles, with the lived experience of moral decision making. He proposes that bioethics involves not only the justifications for moral judgments, but also the understanding of the beliefs and values underlying them. The “old” bioethics, focused in “rationality and generality”, is to be replaced by a new “reoriented” bioethics, situated in the unduly world of “lived human experience”. In other words, context, in its widest sense, is to be integrated into the bioethical framework.

The relevance of social context in moral philosophy is not new, however. As Macintyre tells us in After Virtue: “. . . it also follows that we have not been able to discredit the moral philosophy of any moral philosophy until we have spelled out what its social embodiment would be”. He reminds us that Plato and Aristotle, amongst others, undertook this project. Macintyre, like Hoffmaster, laments the loss of social embodiment in the “narrow conception” of contemporary moral philosophy. I submit that we are now witnessing the rejection of Cartesian dualism and the default position, of an old paradigm—reintegrating the social milieu, narrative, and the emotions, in our conceptualisation of moral philosophy.

Hoffmaster’s second goal is to raise the profile of social science in the field of bioethics. He argues that the distinction between descriptive and normative ethics is artificial, and that the former is unfairly devalued. Together they provide an invaluable tool for everyone, Paul Atkinson’s work with training doctors, and Priscilla Alderson’s ethnographic studies of children and their parents in hospitals, are especially valuable as they bring home the reality of the medical environment of the time.

Anspaugh and Beeson argue that bioethics has neglected the emotions, and describe in detail their role in shaping values and moral decisions, in the development of both philosophical and medical ethics. They describe “moral dissonance” as the conflict between emotions and power. They describe “moral dissonance” as the conflict between emotions and power, and moral decisions. Health professionals need to be able to move freely between emotional engagement and detachment, so that they can embody both fairness and imaginative sympathy towards their patients. Interest in the role of the emotions in moral life has developed in many quarters: neuroscience (notably Antonio Damasio); psychology (Daniel Goleman, amongst others); cognitive science (for example, Mark Johnson), and contemporary philosophy (Peter Goldie, Alasdair Macintyre, Martha Nussbaum, Michael Stocker, and Bernard Williams, to name a few). Modern philosophers are building on the earlier work of Aristotle.

Cate McBurney’s ethnographic study of clinical ethics committees provides a chastening insight into how they can marginalise front line staff (nurses) and patients themselves, objectivity, they argue, is two edged, for it can indicate impartiality and fairness, but also objectification and indifference.

Patricia Marshall’s narrative account of working as a clinical ethicist reveals the conflicts and tensions in that role—particularly the compromise of being part of the institution in which the patient is held captive.

Perhaps Charles Bosk’s chapter on the role and moral standing of the social scientist is the most controversial and provocative. He argues that all social science research involves duplicity, the erosion of informed consent, and the violation of confidentiality. The research subject, flattered to be the object of attention, reveals more than originally intended, but relies on the researcher to safeguard these revelations—a trust that is liable to abuse. According to Bosk, the social
The growth of research ethics committees worldwide is now fairly rapid and new “markets” for research ethics are opening all the time. The market metaphor is appropriate, since a good deal of the impetus for research ethics review comes from the development of new pharmaceutical products, the globalisation of pharmaceutical research, development and marketing, and the internationalisation of regulatory standards for pharmaceutical R&D. The need for independent ethical review of research protocols by a committee drawing on the expertise of professional and lay expertise is established as a moral, a quality-management and a regulatory requirement in many jurisdictions, and internationally in the Declaration of Helsinki, the Council of Europe’s Biomedicine Convention, and the International Committee on Harmonisation’s Tripartite Guideline on Good Clinical Practice.

Central and Eastern Europe have for many years been sites of pharmaceutical R&D, but this has intensified in the aftermath of the revolutions of 1989 and since that time. These revolutions and this intensification have been followed by liberalised markets in health goods and health care; the opening of the state and university sectors to public-private collaborations and private enterprise, creating a fertile context for clinical trials. In addition, the widespread official or unofficial privatisation of health care has created a new set of ethical problems for health care workers, and the beginnings of clinical ethics committees and education programmes. In many cases these beginnings may build on foundations laid down in the 1960s and later after, but the creation of new nation states (or reinvention of old ones) and the changes in political culture, have made important differences to the scope and significance of ethical reflection on health care and biomedical research.

This useful volume summarises the experience of many states in Central and Eastern Europe, together with comparative material from some Western states, including the USA, the USA, Germany, and the Netherlands. The volume includes helpful material on the role of the Council of Europe and the Biomedicine Convention, the international and national regulations defining research and clinical ethics committees, and the special local issues relevant in each of the countries. It is based on a conference held in Bratislava in late 2000 under the auspices of the Council of Europe’s Demo droit Ethical Review of Biomedical Research Activity (DEBRA) programme, designed to facilitate the development of research ethics committees in Europe.

In addition to the useful comparative material, a few papers describe historical factors relevant to the development of ethical review in particular countries. For example, several papers describe the changing nature of university bioethics under the various changes in government over the past 30 years, and several papers describe the changing involvement of the pharmaceutical industry in their countries—including the role of “honic” companies as well as multinational and national firms. A few papers raise philosophical questions about research, research ethics, and research ethics review—the quality of this is good, and they raise some interesting questions which are not often discussed, for example, should ethics committees pronounce on the substantive ethics of a research programme, or only on the actual work planned in this application? For instance, research into the supposed genetic basis of homosexuality, and what the relationship is between ethical review and political culture (does review depend on some form of “pragmatic tolerance” in society and its institutions)? The strong and longstanding philosophical traditions in Central and Eastern Europe are not widely known in the West, and deserve to be better understood. Too much important work in research ethics assumes that the US/UK model is the ideal to be exported. On the evidence of this volume, the potential for a more reflective research ethics lies as much in Eastern Europe as in the USA or the UK, however different the state of institutional development may be.

This book will be useful to researchers planning projects in the various states in Central and Eastern Europe, to scholars of research ethics and its regulations, and to those working in, or otherwise interested in, the development of health care in the region.

**NOTICES**

**European Integration—Philosophy and Ethics of Health Care**

The XVIIth international congress of the European Society for Philosophy of Medicine and Healthcare will be held from August 21–23 2003 in Vilnius, Lithuania. Its theme is European Integration—Philosophy and Ethics of Health Care.

Abstracts are invited addressing the following topics: development of medical philosophy and bioethics; institutionalisation of philosophy and ethics in health care; harmonisation of medical research regulations; human rights and health care; solidarity and health care; just health care; the gap between “academic” and “bureaucratic” bioethics; commercialisation in health care; patenting and genetics; genetic health related databases; research and personal data; use of biological materials, and (future) European guidelines in biomedical research. Abstracts (500 words maximum) should reach the organisers on disk or by email before December 1 2002.

For more information please contact: Prof. Dr Henk ten Have, secretariat ESPMIL Department of Ethics, Philosophy and History of Medicine, University Medical Center, PO Box 9101, 6500 HB Nijmegen, the Netherlands. Fax: 024–340254; from abroad: + 31–24–3540254; email: h.tenhave@efg.kun.nl

**Course: Death Without Suffering**

An Advanced European Bioethics Course, Death Without Suffering, will be held from 31 March to 2 April 2004 in Nijmegen, the Netherlands. Specialists from various countries will discuss ethical issues to do with medically assisted death and palliative care.

Subjects will include: Death, suffering and the concept of palliative care; Death and suffering: ethical perspectives; Ethical issues in pain management in hospice care, and Scientific research in palliative care.

The lecturers will be: D Gracia (Spain), W Dekkers, B Gordijn, H ten Have, D Willems, and Z Zylicz (all from the Netherlands). The language of the course will be English and the price is €295.

For more information please contact: N Steinkamp, University Medical Centre Nijmegen, Dept 232 Ethics, Philosophy and History of Medicine, PO Box 9101, 6500 HB Nijmegen, the Netherlands. Telephone: + 31 24 3615320; fax: + 31 24 3540254; email: n.steinkamp@efg.kun.nl

**Spring Conference: Bioethics in a Small World**

From April 10 to 12 the Europäische Akademie will organise an international conference on bioethical problems connected to the globalisation process. The conference will include sessions on methodological problems—“Bioethics. A science and its application in politics”; “Culture-dependent ethics”—as well as practical problems such as “Research Ethics”, “Access to essential drugs”, “Patents on biomaterials”, and “GMOs and the world’s nutrition problem”.

Speakers will include Abdallah Daar (Toronto), Weyma Lubbe (Leipzig), Edgar Morchler (Salzburg), Udo Schicklen (Johannesburg), Carmel Shalev (Tel Hashomer), Joseph Strauss (Munich). For further information contact the scientific organisers: Richard Ashcroft (r.ashcroft@ic.ac.uk) or Felix Thiele (Felix.Thiele@DLR.de).
