PAPER

Medical humanities and medical alterity in fiction and in life
Brian Hurwitz

ABSTRACT
A widely accepted component of any answer to the question ‘What is it to do good medical ethics?’ is the commitment to benefit people’s health, in principlist terminology, ‘beneficence’. This paper addresses deliberate maleficence and the cultural otherness with which it is associated, focusing on the activities of the serial killer Dr Harold Shipman. It finds an uncanny ‘fit’ between the normal operation of healthcare services and this sort of alterity which has attracted little attention from bioethicists but has been addressed by novelists. To the extent that the medical humanities offers useful insights into hard moral problems, its capacities rest on taking account of both the fictional and the real.

Imagine a world in which healthcare staff no longer subscribe to the principle of beneficence, or do so erratically and unpredictably. Beneficence is so often watered down by respect for autonomy—that ‘first among equals’ of moral principles running counter to it—that one wonders how deterministic it may be of good healthcare.

Imagine now a darker possibility, one in which such contrarian practitioner traits are systematically directed against the medical and healthcare interests of patients. Not long ago, a situation like this arose within the UK National Health Service (NHS). For a long time, hardly anyone noticed, or noticed in a way that led to his apprehension. It concerned a general practitioner (GP), Harold Shipman, who killed his patients in a way that was mistaken forColour and in Life’ published in Status Quaestionis 2014:6: http://statusquaestionis.uniroma1.it/index.php/statusquaestionis/issue/view/1012/showtoc

Aspects of Shipman’s medical practice later came to light which revealed that he was not straightforwardly a good doctor: he had lost a civil action for medical negligence, had faced health service complaints that were upheld, was shown to be a poor (and deliberately inaccurate) record keeper and to have assumed that no effort should be made to resuscitate people he said had become acutely ill at home. For nearly three decades, Shipman continued to practise—and to kill—in apparent coexistence with the beneficence-oriented NHS. The fit between such medical alterity and the apparently normal operation of the health service has hardly attracted notice from bioethicists though it has long been a focus for novelists.

In 1905, the Swedish writer, Hjamar Söderberg, published Doctor Glas, a novel unfolding as the private diary of a GP setting out his decision to murder a patient, the clergyman, Gregorius. Dr Glas is attracted to the parson’s wife, Helga (also his patient) and gives Gregorius a pill telling him it is for his heart. Within minutes Gregorius drops dead (from cyanide poisoning). ‘I heard the clergyman’s tumbler fall over on the tray. I did not want to look, yet I saw his arm fall limply down and his head nod on his breast … I myself wrote out the death certificate.’

Paperwork is often the last act of a medical murderer, in fiction and in fact. By activating the civil mechanisms authorising disposal of dead bodies, it helps ensure foul play masquerades as natural death. As the forensic pathologist Keith Simpson has indicated, such a possibility has long been appreciated but perhaps not always guarded against:

Imagine now a darker possibility, one in which such contrarian practitioner traits are systematically directed against the medical and healthcare interests of patients. Not long ago, a situation like this arose within the UK National Health Service (NHS). For a long time, hardly anyone noticed, or noticed in a way that led to his apprehension. It concerned a general practitioner (GP), Harold Shipman, who killed his patients in a way that was mistaken for beneficence:

I genuinely thought he was a great doctor, very intelligent. I went to see him with different things, and he always had time to talk. You would expect to be kept waiting but you accepted it because you knew he would spend time with you. There was a year-long wait to get onto his list: he was the most popular doctor in Hyde.

I remember the time [he] gave to my Dad. He would come around at the drop of a hat. He was a marvellous GP apart from the fact that he killed my father.

Doctors are in a particularly good position to commit murder and escape detection. ‘Dangerous drugs’ and powerful poisons lie in their professional bags or in the surgery. No one is watching or questioning them, and a change in symptoms, a sudden ‘grave turn for the worse’ or even death is for them alone to interpret. They can authorize the disposal of a dead body by passing the death certificate to the Registrar of Deaths… Are there many doctor murderers? Or are doctors above suspicion?

Simpson hints at how difficult it can be to confront ingrained cultural assumptions and stereotypes about doctoring. When Doctor Glas first appeared in Scandinavia it was felt to be a deeply unsettling work because it exposed the callous mentality of a doctor debating with himself the propriety of murderous malevolence. Similar thoughts play out in Francis Iles’s 1931 novel, Malice Aforethought, whose opening lines set the tone:
It was not until several weeks after he had decided to murder his wife that Dr Bickleigh took any active steps in the matter. Murder is a serious business. The slightest slip may be disastrous. Dr Bickleigh had no intention of risking disaster. 16

The work is an exposé of the unbridled power a country GP enjoyed in the interwar years, its plot turning on how he plans to kill his wife, Julia:

Dr Bickleigh did not think of what he proposed as ‘murder’ at all. Not that he consciously avoided the word. ... Other people ‘murdered’ their wives, but other people’s cases were different. ... In his duties he had put away plenty of pet animals who had passed their usefulness. Now the time had come to put Julia away. 16

He laces her food with a chemical that causes excruciating head pains from which Julia gains relief only by taking opiates which she learns to administer herself by injection. When Bickleigh administers a fatal overdose he passes it off as suicide. In preparation for the act, he mentally divests Julia of her individuality, a process shared by other perpetrators who dehumanise victims ‘to render them as animal like, or as nothing’. 17

The novelist P D James notes that medical killings demand of perpetrators an unusual degree of imperturbability, a sangfroid that enables them to return to clinical practice as if nothing unusual has happened. When superintendent Dalgleish in A Mind to Murder (1963) is called to investigate the death of Miss Bolam, an administrative officer of a west London psychiatric clinic, he finds below the calm exterior of its Georgian façade a set of seething relationships. The culprit, he concludes, must be among them: ‘Miss Bolam, dull, ordinary unremarkable Enid Bolam who had inspired so much hate in someone... As private as that unknown member of staff who would be at the clinic on Monday morning, dressed as usual, looking the same as usual, speaking and smiling as usual and who was the murderer. 18

Literary exploration of grotesque medical invasion plays on our fears of a loss of orderliness in healthcare, on its arrangements becoming contingent on goals and purposes disconnected from ethical principles such as beneficence. Large-scale institutions are seen to be manipulable, subject to gaming by agents not signed up to the core values of healthcare. John Collee’s A Paper Mask (1987) reveals how easily medical power can be assumed without any training or authority. The novel concerns a hospital that culturally sanctioned to access hundreds of homes and invite elderly patient-victims who have been alone at home (who else but a GP is allowed to enter in the most matter of fact way 26) to his presence, from a heart attack or stroke, or leave the body to be found later in his bag his lethal weapon (and) by which he would set about in the most matter of fact way...26

In Shipman she found something unassimilable. The weapon that so chilled her was a syringe loaded with diamorphine. Typically, Shipman would call round in the afternoon when elderly patient-victims were alone at home (who else but a GP is culturally sanctioned to access hundreds of homes and invite himself round for a friendly chat and a lethal injection?). He would report the death as having occurred in his presence, from a heart attack or stroke, or leave the body to be found later in the day by a relative or friend. Shipman would complete the death certificate giving a plausible but false story of pre-existing disease and press the relatives to cremate the body, so destroying toxicological evidence.

The barrister and psychiatrist, Dr B Mahendra, argues that the medical profession was complacent to see Shipman simply as ‘a purveyor of evil ... a perverted “one-off”,’ 27 because it distracted attention from how such killings could become a routine aspect of the NHS. As Richard Baker and I have argued, killing can only ever be routine—as in the novel Coma—where obstacles to its accomplishment have been fully annulled, ‘where all, or almost all, health service and civil systems for monitoring... around the time of a patient’s death, are so inadequate as to allow murder in the same way, by the same means, by the same man, to become repeated and established over decades.’ 28 But equation of Shipman with evil stemmed also from failure of...

-mation and cremation procedures he has not been treated as such.

-ting massive overdoses of patients’ usual medication.

Between 1990 and 2006, 90 health professionals worldwide faced prosecution for serial killing of whom half had been con-

-cted massive overdoses of patients’ usual medication.

Nurses comprised 86% of prosecutions, doctors 12% and allied health professionals 2%. The number of legally proven murders came to 317, and of suspicious patient deaths, 2113.33

These figures challenge the view that Shipman was a ‘one-off’. Judged by modifications made to UK death certification and cremation procedures he has not been treated as such. Neither the fictional nor the real tells us when, where, or how transgression on this scale may reappear in health care services, but further research into how stereotypes of beneficence and maleficence are culturally created and symbolically constituted promises greater insights into how they influence patient preferences in choosing a good doctor.

biographical and psychological studies to account for his actions. He never admitted wrongdoing, showed no remorse, and refused to speak to psychiatrists. His family has never shed light on his personal world (Shipman committed suicide in Wakefield Prison in January 2004). No credible link can be estab-

ished between Shipman’s clinical programme and psychological state, drive, sense of purpose or motive. It is there-

fore not possible to bring his actions into relationship with anything verifiable about his psychological make-up. This makes his actions strictly incomprehensible, akin to the uninte-

gratable ‘other’ Levinas identified with ‘radical evil’.60

How does it help to see Shipman’s alterity through a fictional lens? Bernard Williams held that the way to ‘understand people’s behaviour in terms of virtues and vices is in terms of stereotypes or standard images... ranging from crude ‘characters’ and more individuated outlines constructed with the help of type drawn, often, from fiction’.71 This is not to endorse fiction with the same sort of worthy referentiality as a witness

Fiction cannot stand-in for the missing inner life, thoughts or motives of a particular criminal, but by absorbing cultural ambivalences about doctoring and instabilities of medical stereotypes, symbolic exchange between virtues and vices become apparent. Shipman incarnated such instabilities in a highly intensified form. Emerging from a UK medical school to become a respected figure within the NHS in his locality, he displayed qualities sought after by locals. Even after his convictions, people remained strikingly complimentary about him, suggesting a classificatory confusion and in-between status in which good and bad qualities can comeingle. Such a formulation suggests a type-antitype analysis that positions Shipman as an anti-type, something ‘shadowed forth’ in the guise of a type. The
term comes from the Latin antitypus, meaning ‘responding as an impression to the die’,72 formed by the same structures, processes and forces that shape the type. Compared with the type, antitypes display contrastive features ‘more intense and more significant than their types’.73 Shipman’s willingness to visit at home without even being requested to was just such a distinctive and unstable benevolent/malevolent feature.

Data on home-visiting rates are not routinely collected in the UK, but Shipman’s reputed position way above the curve of declin-

ing visiting rates might have been a clue to his character and activ-

ities.74 Patients clearly valued this malevolent propensity which
data that could be made to UK death certificat-

ong to accommodate his purposes. Within the NHS is foreshadowed by the novel

How does it help to see Shipman’s alterity through a fictional lens? Bernard Williams held that the way to ‘understand people’s behaviour in terms of virtues and vices is in terms of stereotypes or standard images... ranging from crude ‘characters’ and more individuated outlines constructed with the help of type drawn, often, from fiction’. This is not to endorse fiction with the same sort of worthy referentiality as a witness statement or a history, but to appreciate it for its capacity to take on board moral possibilities beyond (though not excluding) the familiar and the real. Behind the idealised and comforting figures of trustworthy and caring doctors, fiction performs in terrible detail what Keith Simpson in the extract of his Forty Years of Murder quoted above only felt able to intimate.

Injection is the method of choice of healthcare serial killers ‘followed by suffocation, poisoning, and tampering with equipment’,75 the US killer, Swango, adopting the variant of administering massive overdoses of patients’ usual medication. Between 1990 and 2006, 90 health professionals worldwide faced prosecution for serial killing of whom half had been conv-

icted by the time of the publication of a systematic review. Nurses comprised 86% of prosecutions, doctors 12% and allied health professionals 2%. The number of legally proven murders came to 317, and of suspicious patient deaths, 2113.33

These figures challenge the view that Shipman was a ‘one-off’. Judged by modifications made to UK death certification and cremation procedures he has not been treated as such. Neither the fictional nor the real tells us when, where, or how transgression on this scale may reappear in health care services, but further research into how stereotypes of beneficence and maleficence are culturally created and symbolically constituted promises greater insights into how they influence patient preferences in choosing a good doctor.
